Who did so much to pioneer community-based adaptation in resource-poor communities.
ABSTRACT

In this study, the linkages between sustainable development, disaster-risk reduction and governance are explored, with reference to climate change adaptation. The purpose of the assessment is to ascertain the effectiveness, or lack thereof, of these inter-linkages with regard to climate change adaptation in South Africa. First, a brief review of theoretical debates on sustainable development, disaster-risk reduction, governance and climate change adaptation is given. Currently, it seems, sustainable development, disaster-risk reduction and governance are viewed exclusively from each other and from climate change adaptation. Some theoretical debates suggest that successful, long-term climate change adaptation can only be accomplished if linkages between these concepts, and practices, where relevant, are recognized in development policies. There is thus, a need to understand the relationships between climate change adaptation and development policy AND their linkages and tradeoffs. Coupled to this understanding, there is also a need to assess the role of institutions as well as institutional barriers that may retard or pose a threat to long-term sustainable adaptation.

For this case study, the focus is on the 2004/05 drought that occurred in the Eastern Cape. The drought of 2004/05 was particularly severe. Some parts of the Eastern Cape were declared disaster areas. This declaration prompted responses from the various spheres of government, e.g. national, provincial and local. The intention therefore is, firstly, to gain clarity on the linkages between development/sustainable development policies, disaster-risk reduction and governance in the Province that operated during this period and in the periods following this drought. Secondly, the intention is to understand how the spheres of governance work together in responding to climate-related disasters. Responses from the community reveal that coupled to poor development planning; there is also limited and poor institutional capacity to respond to the direct and indirect impacts of climate variability and change. This poor institutional capacity is further complicated by a lack of coordination between the three spheres of government, i.e. national, provincial and local, as well as across national government departments.

It is suggested that first, a good structure of cooperative governance and disaster-risk reduction is needed in South Africa. This structure should allow for multi-faceted and holistic development planning that focuses on saving lives, protecting livelihoods and assets. A good structure of governance should provide an environment that is sustainable and conducive to long-term climate change adaptation. What this case study also reveals is that monetary relief and assistance alone is not an effective response to climate variability and change. What is thus also needed is more vigilant monitoring of development projects and relief-funds as well as coordinated governance of development activities between national, provincial and local governments. Such an organized structure of governance could aid the country in gearing up for climate change adaptation.
PREFACE

In the past decades, distinct and independent research and policy areas and communities related to climate change adaptation have emerged internationally. Most notable in these research areas are the concepts of development and/or sustainable development and disaster-risk reduction. In South Africa, while there is a very strong disaster-risk reduction policy and acknowledgement of the need for effective sustainable development there is a paucity of any effective climate change adaptation. One area where this problematique can be seen is when one examines the institutional governance structures designed to reduce risks to climate risks (in this case severe drought). In this thesis the implementation of policies related to climate change adaptation, sustainable development and disaster-risk reduction is shown to be largely dependent on responsible governance and effective coordination of governance structures. The potential for increased disaster-risk associated with climate change, has spurred efforts to understand appropriate and effective adaptive climate change measures as a matter of urgency. Reducing impacts associated with climate change and climate variability has become a priority due to the threats the impacts pose to sustainable development. As such, there is a need to shift the focus on understanding climate variability and change from a hazard’s science perspective to understanding the alignment and integration of response to disaster-risk reduction and development. With this brief introduction the various sections of this thesis are as follows:

Chapter 1 presents a rationale for this study. Aims and objectives of the study are also outlined. The rationale for the study area is given. The area is sensitive to climate-risk and experiences several variations in climate including droughts. A framework adopted from Schipper and Pelling (2006), for effective disaster-risk reduction is presented.
Chapter 2 gives the research methodology and how the study was carried out. Firstly, a brief background on the Eastern Cape Province is given. This is followed by a more detailed account on how the different phases of research were carried out.

Chapter 3 presents a discussion of relevant literature on key concepts such as disaster-risk reduction, sustainable development and governance, which are crucial to the successful implementation of effective adaptation. Using droughts as an example of climate stress, case studies internationally and in Africa are then examined, foregrounding the urgency of adaptation and the need to better manage such disasters.

This is followed in Chapter 4 by an examination of similar concepts raised in Chapter 2, with specific reference to the South African landscape, including the structure of governance as per the Constitution of the Republic of South Africa.

Chapter 5 presents a discussion of research findings and is an attempt to assess the success of plans for reducing risks to future climate stress. Attention is specifically given to an analysis of development initiatives and the national and local coping mechanisms to the drought of 2004-2005.

Chapter 6 presents additional research results, but focuses more on the examination of disaster-risk reduction responses and costs related to the 2004/05 drought. The role played by institutions, including relevant policies, are also explained. An illustration, in terms of a framework, for the existing structure of governance is presented.
Finally, in Chapter 7, the important findings of this work are summarized. Lessons emerging and challenges that are/will be faced in implementing adaptation to climate change and climate variability are provided for South Africa.

**Outcomes of this study:**

This study has been presented in the following forums:

1. 24 May 2006, Students Climate Change Symposium, University of Pretoria.
2. 24 May 2007, Presentation given to visiting students of the University of Virginia, Gold Reef City Museum, Johannesburg.
3. 15 July 2008, Draft Thesis presented to the National Climate Change Committee of South Africa at a meeting held at SANBI Biodiversity Centre Auditorium, Pretoria.
4. 4 March 2009, Draft Thesis presented at the National Climate Change Summit, held at the Gallagher Estate, Midrand, Johannesburg.
