Identifying and addressing factors affecting academic success of at-risk biology students: Attitudes, work-habits and metacognitive knowledge

Ellis Koe Ayayee

A thesis submitted to the Faculty of Science, University of the Witwatersrand, in fulfilment of the requirements for the degree of Doctor of Philosophy.

Johannesburg, May 2012
Successful tertiary-level education in the biological sciences is crucially important in providing a high-level work force for a number of careers. The government of South Africa has realised the strong positive correlation that exists between the availability of scientific and technical human resources, the viability of the economy, and the well-being of its people. However, despite government policies and tertiary institutions efforts in South Africa to increase enrolment and improve students’ throughput, the pass rates at first-year university level remains low, a source of concern for the government and affected institutions. The low pass rates of first-year students in the biological sciences at tertiary institutions constituted the problem which prompted the study.

The aim of this study was to identify factors perceived to be essential for academic success in first-year biological sciences at the University of the Witwatersrand, South Africa, and to investigate the effects of a computer-based programme designed to address some of the factors. The programme was developed to help students increase their awareness of appropriate attitudes, metacognitive knowledge and work-habits, all of which contribute to achieving academic success.

The study had two main phases, a “diagnostic” and a “therapeutic” phase. The research methods adopted in this mixed-methods study included the use of interviews and questionnaires to elicit information from various stakeholders.

In the diagnostic phase, interviews were used first to elicit the perceptions of 10 lecturers teaching first-year biology courses, 8 Honours students, and 17 undergraduates, at the University of the Witwatersrand, about factors they believed influenced academic success. The five top-ranked factors influencing academic success were being motivated, using appropriate study habits, having positive attitudes to studies, asking for help and clarification, and managing time effectively. Whilst the above-mentioned were the common factors identified by the three samples, each stakeholder group made its distinctive contributions. Secondly, to obtain a wider perspective of first-year students’ views, a questionnaire focusing on attitudes, work-habits and metacognition was administered to two large groups of students (n=145; n=100) at the end of two consecutive years. The three top-ranked factors in both samples had to do with academic behaviours: attending all lectures; taking accurate notes; and asking for help and clarification when a topic was not understood.

Eighty-three first-year students provided data on students’ changing perceptions (at the beginning and end of the year) which were required to determine if, without an intervention, a year at the university influenced students’ perceptions about appropriate factors influencing academic success. Rasch analytical techniques applied to 27 items in the questionnaire yielded 11 responses which were statistically significantly different. These responses were later addressed in the package because students needed this information from the start of their studies.
During the therapeutic phase a computer-based instructional programme, *Bioskills*, was designed to inform student users about attitudes, behaviours and metacognitive factors the literature and stakeholders said were important for academic success. Six experts and 75 first-year students provided comments as part of a formative evaluation during its development. These were used to modify the screen design, user interface and content of the alpha version of the package. *Bioskills* proved very easy to use, even for first-time computer users.

A case-study approach was used to explore the experiences of eight students with *Bioskills*, in particular its influence on their attitudes, metacognition and academic behaviours. All eight students made positive comments, including that it was relevant, informative and encouraging. Six out of the eight recommended it be used much earlier in the year, whilst two said it took too much time to work through. Without trying to imply causation, the four students who used *Bioskills* three or four times passed the first-year course they were doing.

Students’ metacognitive gains were reported in terms of metacognitive knowledge (what students know about successful learning) and metacognitive control (their application of the knowledge). The small sample size (n=8) made it difficult to detect trends. However, individual students mentioned new attitudes (being more determined, showing more interest in the topic and applying more positive attitudes to their studies) which they claimed they learned from using *Bioskills*.

Attribution is traditionally explained as *a search for understanding of causes*. Students’ attributions on specific academic tasks are therefore important in the remediation efforts by educators. Of the 38 factors identified by the eight students, as causes for poor performance in their June examination, before they used *Bioskills*, almost two-thirds, when categorized using attribution dimensions, were of internal but unstable dimensions. The literature suggests it is easier to remediate causes that are internal and unstable rather than external and stable. After using *Bioskills*, four of the eight students who performed well at the end of a teaching block ascribed their success to the effort they had put in, whilst two of the four who did not do well, blamed external factors (the length of the test, the question structure) as contributing to their poor results.

The important contribution this study made was the theoretical framework developed which expanded the existing attitude-behaviour models by adding additional constructs and showing the relationships between them. In addition, a summary of factors mentioned by the stakeholders and supplemented with views from the literature have been used to propose a conceptual model of factors influencing academic success. The thesis concludes by discussing the implications of the constructs in the model for improved academic performance and as an area for further research.
DECLARATION

I declare that, apart from the assistance acknowledged, this is my own work. It is being submitted for the Degree of Doctor of Philosophy at the University of the Witwatersrand, and has not been submitted before for any degree or examination at any other university.

Ayayee Ell

14th day of May 2012

Ellis Koe Ayayee
DEDICATION

I dedicate this work to the incoming biological sciences Extended Curriculum and Academic Development programme students and lecturers. I hope the computer programme, which was developed as part of this work, contributes to an early appreciation of the factors that promote improved academic performance at this University, and also leads to the further appreciation of the affective factors.
ACKNOWLEDGEMENTS

But for the concerted effort of the following organisations and individuals this thesis would not have seen the light of day.

Professor Martie Sanders who guided the design and completion of this project, thank you, for not giving up on the project.

Professor Kevin Balkwill, the Head of the School of Animal, Plant and Environmental Sciences, who, so that the thesis could be completed, supported my application for extended time-off leave.

I wish to acknowledge an initial NRF grant which enabled me to undertake the PhD study, and two time-off sabbaticals granted by the School which were funded by grants from the Carnegie Foundation (2007) and Mellon Foundation (2009).

The support and input from the following people are acknowledged:

- Mr David Auku, a Christian brother and systems analyst, who offered support and direction in the use of Macromedia Dreamweaver.

- Mr Tyler Morgan, who hosted *Bioskills* on the University’s website and later, when the University’s domain was faulty, kindly hosted it on his personal website for my external examiners to view.

- Dr John Fletcher, whose knowledge and skill in using Rasch (Winsteps), contributed to an easier analysis of the data.

- The six experts whose views were used in the validation of the package are gratefully acknowledged.

- Professor Shirley Hanrahan, my mentor, so considerate and supportive as I worked through the chapters.

- Ms Carol Still, my colleague in the Extended Curriculum programme, who gave up semesters of well-deserved leave in order that this study might be concluded.

- The unwavering support of my children Eyram, Ayitey, Korkoi and my dearest wife Effie as the “chapters” were being written is appreciated.

- The unsung, unheralded well-wishers who spared a thought for me, herein lies the thesis, that your sweet thoughts gave wing to.

Figure 5.3 Schematic diagram of stages in the transtheoretical model of behaviour change ......................................................................................................................... 123

Figure 5.4 Home section of Bioskills showing tabs, buttons and navigational aids ........................................ 127

Figure 5.5 Mind map of the initial five sections of Bioskills ..................................................................... 129

Figure 5.6 Screen from Bioskills highlighting the tone and relevant graphics used to create authentic context and motivate students ................................................................................................. 129

Figure 5.7 A video clip in a screen from Bioskills highlighting an authentic classroom context and used to motivate students ......................................................................................................... 131

Figure 5.8 Screen from Bioskills showing students how goals are set ..................................................... 131

Figure 5.9 Diagram showing portions of how the transtheoretical theory was implemented in Bioskills ................................................................................................................................. 132

Figure 5.10 Flow chart of the research plan for the therapeutic phase ..................................................... 134
CHAPTER 6

Figure 6.1 Distribution of mid-year marks of students (n=60) attending Academic Development tutorials in the second half of the year ........................................ 147

Figure 6.2 Flow chart of the research design of the investigation of the effectiveness in the therapeutic phase .............................................................. 148

Figure 6.3 Introduction to activity-based questionnaire 1 ................................................................. 150

Figure 6.4 The first task in activity-based questionnaire 1 .............................................................. 150

Figure 6.5 Extract from the second task in activity-based questionnaire 1 .................................... 151

Figure 6.6 Extract from the third task in activity-based questionnaire 1 ........................................ 151

Figure 6.7 Fourth task from activity-based questionnaire 1 .............................................................. 152

Figure 6.8 Extract from the fifth task in activity-based questionnaire 1 ........................................ 152

Figure 6.9 A sample of the call-out box on task 1 in activity-based questionnaire 2 .................... 153

Figure 6.10 Extract from a check-list included in questionnaire 4 .................................................. 153

Figure 6.11 Example of a task in activity-based questionnaire 5, Bioskills and you ..................... 156

CHAPTER 8

Figure 8.1 The major factors that the stakeholders mentioned which influence academic success ........................................................................................................... 222

Figure 8.2 Conceptual model of factors influencing academic success ......................................... 225

Figure 8.3 Statements responded to at the start and end of the year, which showed significant differences (p=0.05) in students’ level of agreement, measured in Rasch units (n=83) .................................................................................................................. 228

Figure 8.4 Attitudes and behaviours of top students which showed significant differences in students’ perceptions at the start and end of the year (n=83) .................................................................................................................. 230

Figure 8.5 Students intentions and the number of students who did or did not implement their intentions during semester one, before using Bioskills .................. 233

Figure 8.6 Attribution dimensions for poor performance in the June examination based on students’ reported causes from 38 statements (n=8) .................................................. 235
# LIST OF APPENDICES

<table>
<thead>
<tr>
<th>Appendix</th>
<th>Description</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Appendix A</td>
<td>Three interview schedules (A1, A2 &amp; A3)</td>
<td>242</td>
</tr>
<tr>
<td>Appendix B</td>
<td>The questionnaire for Introductory Life Sciences students</td>
<td>250</td>
</tr>
<tr>
<td>Appendix C</td>
<td>Paper presented at the SAARMSTE 2008 Conference (Fletcher, Sanders &amp; Ayayee, 2008)</td>
<td>254</td>
</tr>
<tr>
<td>Appendix D</td>
<td>Two questionnaires for experts: Your views and comments about Bioskills</td>
<td>262</td>
</tr>
<tr>
<td>Appendix E</td>
<td>Two questionnaires for first-year students</td>
<td>268</td>
</tr>
<tr>
<td>Appendix F</td>
<td>Activity-based questionnaire 2: Tell us what you learnt from using Bioskills</td>
<td>275</td>
</tr>
<tr>
<td>Appendix G</td>
<td>Activity-based questionnaire 1: Taking action to improve your marks</td>
<td>279</td>
</tr>
<tr>
<td>Appendix H</td>
<td>Activity-based questionnaire 3: Setting goals for Block 3</td>
<td>284</td>
</tr>
<tr>
<td>Appendix I</td>
<td>Activity-based questionnaire 4: Preparing for practicals</td>
<td>295</td>
</tr>
<tr>
<td>Appendix J</td>
<td>Activity-based questionnaire 5: Bioskills and you</td>
<td>298</td>
</tr>
<tr>
<td>Appendix K</td>
<td>Semi-structured interview schedule</td>
<td>301</td>
</tr>
