AN ASSESSMENT OF THE RISK FACTORS FOR PULMONARY TUBERCULOSIS AMONG ADULT PATIENTS SUFFERING FROM HUMAN IMMUNODEFICIENCY VIRUS ATTENDING THE WELLNESS CLINIC AT THEMBA HOSPITAL.

Félix Alberto Herrera Rodríguez
DECLARATION

I, Dr. Félix Alberto Herrera Rodríguez, hereby declare that this research report is the result of my own work. It is submitted for the degree of Masters in Family Medicine to the University of Witwatersrand, in Johannesburg. It has never been submitted before for any other examination or degree at any other institution or university.

An approval from the Ethics Committee for Research on Human Subjects (Medical) was obtained with the approval number M080416.

____________________________________
Dr. Félix Alberto Herrera Rodríguez
On this 25 day of September 2013
To my wife Ariana and my two daughters, Alicia and Ariamna
with thanks for your unconditional love and support,
for believing in me and for inspiring me
to be a better human being.

It is also dedicated to my father, my mother and siblings
whose love I will always appreciate.
ABSTRACT

Background: Tuberculosis (TB) control and management, worldwide remain a huge medical and social challenge. In South Africa the data about risk factors for pulmonary tuberculosis (PTB) is limited. Therefore the assessment of risk factors for PTB is an important step to identify which risk factors are unique in every specific population context and in this way gain a better understanding of them. The overall aim of the research was to assess contributory risk factors for PTB among adult patients suffering from Human Immunodeficiency Virus attending the Wellness Clinic at Themba Hospital.

Methods: A cross sectional descriptive study was employed in this study. A total of 300 participants were interviewed one-to-one. A structured interview, using a questionnaire, was used to collect data on socio-demographic information, behavioural factors and medical history of patients in the research. Data were analysed using Stata Release 11 software. Univariate and multivariable logistic regression models were used to determine factors associated with PTB.

Results: In this study there were more female (67.0%) than male (33%) patients. The mean age of patients was 38.2 years with standard deviation (SD=10.9 years). Two thirds of the participants (69.3%) had low level educational. More than half (65.7%) of participants reported being single. The majority of participants (59.7%) were unemployed. A large proportion of the patients (63.3%) reported living in a non-overcrowded environment and (64.7%) reported living in dusty outdoor environment. The majority of the patients (75.0%) were non-smokers while most (89.7%) were non-drinkers and (52.7%) reported not to have previous medical history of PTB or treatment. More than half (65.0%) of the participants reported not to have family history of PTB. Finally being single marital status (OR=1.96; 95% CI=1.01-3.79), moderate drinker/heavy drinker (OR=3.46; 95%CI=1.56-7.69) and living in a dusty outdoor environment (OR=2.05; 95% CI=1.16-3.61) were all statistically associated with pulmonary tuberculosis in multivariable logistic regression models.

Conclusions: Single marital status, dusty outdoor environment and moderate drinker/heavy drinker were strongly associated with an increased risk of PTB. Future PTB control and prevention strategies should focus on interventions, which will ultimately reduce or limit the impact of risk factors for pulmonary tuberculosis.
ACKNOWLEDGEMENT

First, I would like to thank God for giving me faith, strength and blessing to succeed and fulfil my destiny. I would like also to say thanks to the Department of Family Medicine at the Witwatersrand Faculty of Medicine of Johannesburg for granted me the opportunity to continue and complete this Master Degree. My appreciation and thanks are extended to Professor Bruce Sparks former Head of the Department, and Professor Ian Couper for their guidance and leadership.

A very special word of thanks, respect and gratitude to Dr. Anne Wright, the course coordinator for her inspiration, continue support and encouragement to be successful with this study. My fully appreciation to my Research Supervisor, Dr. Samuel Onoja Agbo, and many thanks for his advice, and correction notes to complete this work on time. I am gratefully to Dr. Misael Fernandez Silva and Dr. Fernando Rosado Aguilera: fellows’ colleagues and friends for all their advice and encouragement to finish this project. Thanks to Dr. Alfredo Del Cueto, Dr. Juan Lista, Dr. Elpidio Lopez, Dr. Antonio Diaz and Dr. Stefano Fieremans for your inspiration.

I am indebted to the staff of Wellness clinic and special to Dr. Robbi Ntambi at Themba Hospital for their assistance. To Mrs Pamela Jones, sincere thanks for reviewing and proof reading of this paper. I gratefully acknowledge the advice and statistical assistance of Professor Piet J Becker from the Biostatistics Unit of the South African Medical Research Council (MRC) in Pretoria. I also acknowledge Dr. Tabither Muthoni Gitau faculty’s statistician for her advice and support during the consultations sections.

Thanks to all the staff of Family Medicine Department at the Witwatersrand Faculty of Health and science. Special thanks to my family and all my other friends, colleagues and associates.

Finally, my gratitude goes to all the patients, without whom the study would have been possible.
