STATEMENT OF ORIGINALITY

The research work contained in this thesis was conducted between February 2002 and May 2004. It is original work except where due reference is made. It has not been and shall not be submitted for the award of any degree or diploma to any other institution of higher learning.

Signature…………………………..
ACKNOWLEDGEMENTS

First, I would like to thank God for bringing me this far and for giving me the wisdom, the courage and the strength to go on.

I would like to acknowledge my gratitude to every one who gave encouragement, advice and assistance.

I thank my supervisor Professor C. Vogel for her continued support and guidance throughout this work. Despite her hectic schedules (teaching, research, meetings, raising a family) she has managed to find time to guide me through this research. I am very grateful and I appreciate her enthusiasm and interest in my work.

Special thanks are extended to all the respondents. Without your cooperation this work would not have been completed. I appreciate all your efforts.

Very special thanks to my parents Dr and Mrs. Babugura and my in-laws Dr and Mrs. Magembe for all their support and encouragement. Without them I would not have come this far. Thank you for helping look after my beloved daughter Lisa while I did my work.

Thanks to my Brothers Alex and Donald, to my sisters Christine, Doreen and Celia for their support. I am very grateful for all your assistance. Thank you all for being there when I needed you. Thank you for keeping my beloved daughter Lisa company when she really needed it. Knowing that she was happy and being entertained allowed me to do my work in peace.

Khamarunga, Mr and Mrs Munthali, Maria Kiire and Gina, thank you so much for all your support. I will be forever grateful.

To START, thank you very much for the award and a great opportunity to attend the International Young Scientist Conference on Global Environmental Change.
Finally, I would like to thank my beloved husband for his continuous support, motivation and encouragement.
DEDICATION

This thesis is dedicated to my daughter Lisa and my husband Steve. They have been my inspiration and motivation throughout this work. I love you both.
PREFACE

This study focuses on vulnerability to climate variability in Botswana. The study examines vulnerability of rural societies and the configuration of forces that shape their ability to cope and adapt to climate variability. The research was sponsored by START. START is a non-governmental, non-profit organization that seeks to establish and foster regional networks of collaborating scientists and institutions in developing countries.

Over the three years of writing my PhD, I had the opportunity to attend the First AIACC (Assessment of Impacts and Adaptation to Climate Change) Regional workshop and open meeting for Africa and Indian ocean Islands. This workshop was held in South Africa, in the year 2003. I also attended the International START Young Scientists Conference on Global Environmental Change, which took place in Trieste, Italy in 2003. In 2004, I had the opportunity to attend the Norway + SAVI workshop held in Johannesburg, South Africa. From these workshops and conferences I have gained valuable insights into vulnerability assessment.

In 2002, I was awarded a START scholarship, which included tuition and research. This is a highly recognized scholarship that is awarded to selected young scientists. I was also selected by START to present a paper at the International START Young Scientist Conference on Global Environmental Change, which was held in Trieste, Italy in November 2003. Currently I am in the process of preparing a paper for publication.
ABSTRACT

Due to increasing rapid environmental change, coupled with changes in social, economic and political conditions, vulnerability assessments have become increasingly important for understanding society’s capacity to deal with such changes. The aim of this research is to examine vulnerability of rural societies as well as the configuration of forces that shape their ability to cope and adapt to climate variability. The study compares two rural societies living in different climatic regions in Botswana. These are, the southwestern part, which has the driest climate and the northern part, which has the wettest climate. This detailed study will help us understand how different societies and individuals, living under different climatic conditions, shape their livelihood systems to buffer against climate variability.

Historical analysis, secondary sources, questionnaires, participatory rural appraisal and observation are some of the methods used to capture data. The study demonstrated that climate variability has had various impacts on the communities of Matsheng and Kasane. In an attempt to cope with the impacts of climate variability, various mechanisms are used. These include, reliance on government assistance, temporary migration, reduced number of meals eaten per day, engagement in labour for cash or in-kind, formal employment and prostitution. Several constraints were found to affect coping and adaptation strategies in Kasane and Matsheng. These constraints include, poverty, HIV/AIDS, unemployment, gender inequality and environmental factors. The study also demonstrated that female-headed households are the most vulnerable to climate variability. Vulnerability of female-headed households can mainly be attributed to poverty and inequality.

In conclusion, the study provides knowledge based on peoples experiences, which will help planners and policy makers to come up with more effective measures for reducing vulnerability to climate variability and possible future changes in climate. The knowledge will also contribute to understanding the process of social adaptation to past and current climatic conditions.
