

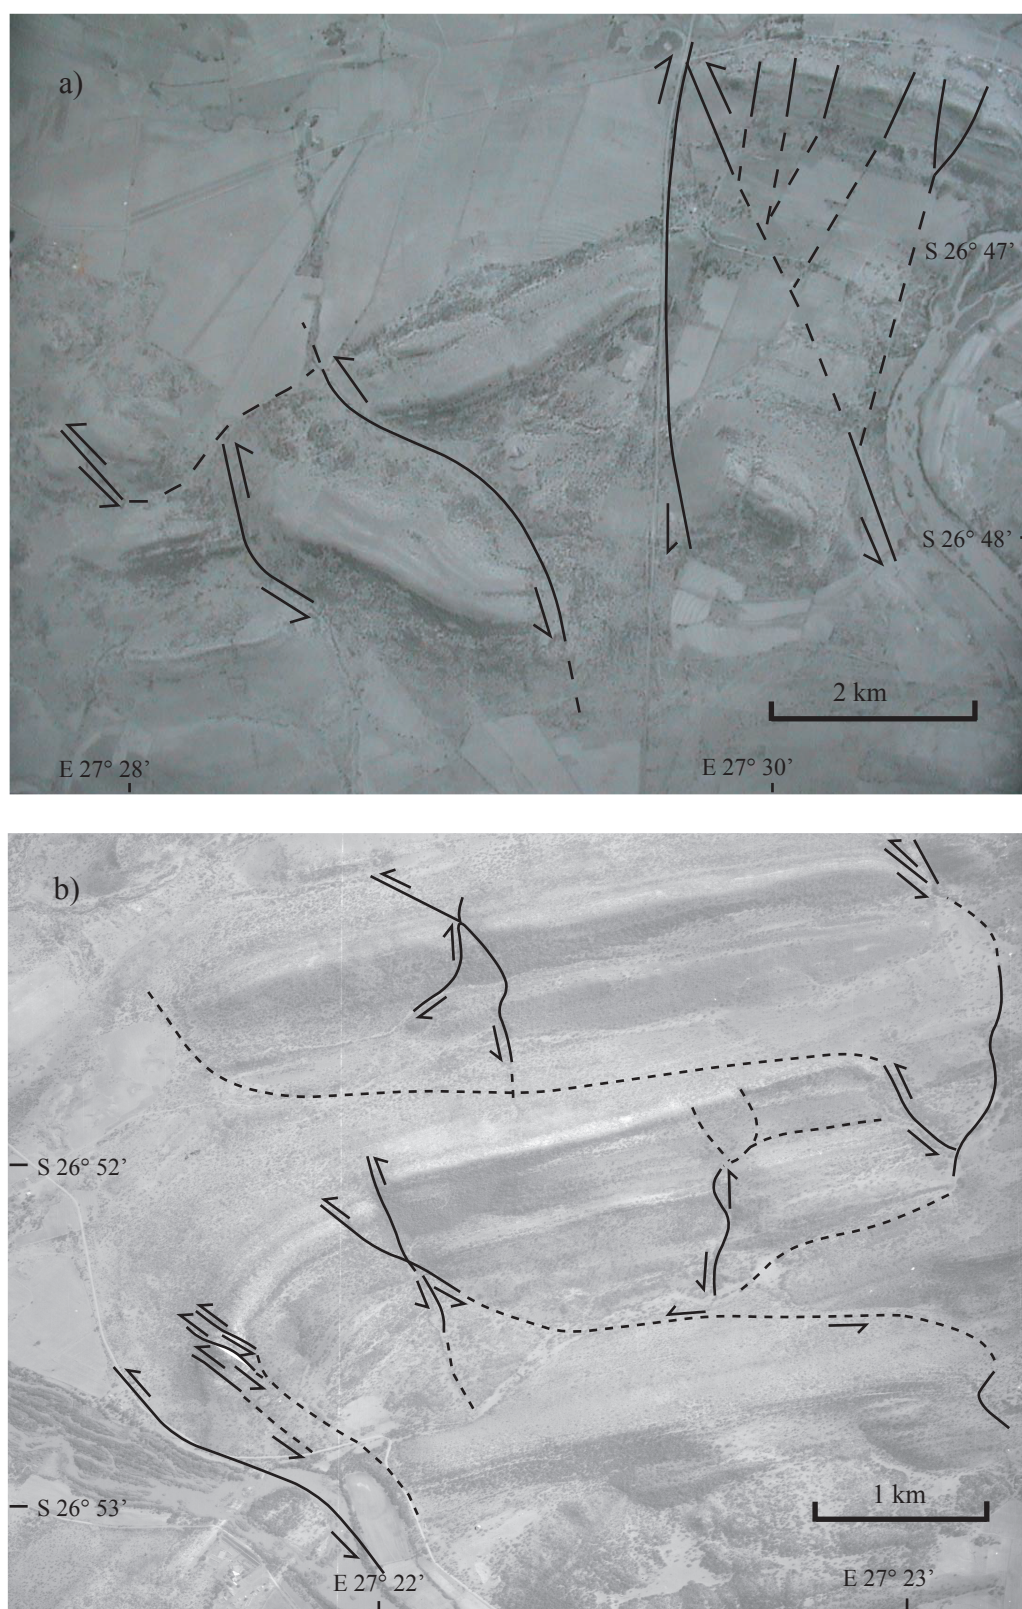

Fig. 2.20: (a) Large-scale faults with radial and tangential strike orientations and displacements of hundreds of metres indicated by displaced West Rand Group quartzites. Fault traces confirmed by surface mapping are shown with solid lines, inferred faults are shown with dashed lines. See text for further detail. (b) Example of a homoclinal, asymmetric fold (fold E) in the northern part of the collar (see Fig. 2.16), which is associated with large-scale, radial faults. These faults are shown by solid lines where their existence was confirmed by surface mapping.
