

**AGE-RELATED PERCEPTIONS OF FACIAL PROFILE ATTRACTIVENESS IN
SOUTH AFRICANS**

Ajay Morar

A research report submitted to the Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, in partial fulfillment of the requirements for the degree of
Master of Dentistry in the branch of Orthodontics.

Johannesburg, 2010

DECLARATION

I, Ajay Morar, declare that this research report is my own work. It is being submitted for the degree of Master of Dentistry in the branch of Orthodontics of the University of the Witwatersrand, Johannesburg. It has not been submitted before for any degree or examination at this or any other University.

DEDICATION

This research is dedicated to my wife Farhana, my son Aman and daughter Neha, without whose inspiration none of this would have been possible.

ABSTRACT

This study evaluated the influence of age on the perception of facial attractiveness in three samples of South Africans. Eight digitally morphed lateral facial profiles were created by means of computer animation software and presented, in sequential order, to 1798 school learners, 694 university students and 323 school teachers. Each participant was asked to complete a questionnaire in addition to choosing a single face he/she perceived to be the most attractive.

Statistical tests included frequency distributions, percentages, cross-tabulations, odds ratios and the Pearson Chi-square test. Results demonstrated that age was a factor in the perception of facial attractiveness particularly amongst individuals of school-going age. Thereafter, increasing age did not exert a significant influence on the perception of profile preference. There was a definite trend towards the preference for less protrusive facial profiles. Nevertheless, due consideration should be given to the individuality associated with aesthetic choices as a significant proportion of raters did indicate a preference for profiles exhibiting mild protrusion. Furthermore, race and cultural background do appear to play a significant role in the perception of facial profile preferences.

It is suggested that future studies of a similar nature be undertaken in order to provide the data to permit comparison with the results reported in this study.

ACKNOWLEDGEMENTS

Sincere gratitude is due to my supervisor, Professor Errol Stein, for his guidance and sage advice in the execution and preparation of this research report.

Many thanks to Professor Piet Becker of the Biostatistics Unit of the Medical Research Council and Honorary Professor in the School for Therapeutic Sciences, University of the Witwatersrand, for his assistance with the statistical analyses.

The assistance of the administrative staff and the participation of the teaching staff and school learners from the participating schools as well as the teaching staff and students of the Medical School campus of the University of the Witwatersrand is gratefully acknowledged.

The editorial assistance and critique of Professor Bill Evans, Acting Head of Orthodontics in the School of Oral Health Sciences, University of the Witwatersrand, is gratefully acknowledged.
