The views and opinions expressed do not purport to be those
of the Faculty of Education or the Council of the University
of the Witwatersrand, or the Johannesburg College of
Education.

EDITORIAL

This special issue of Perspectives in Education comprises
four articles which discuss aspects of the Report of the
Main Committee of the Human Sciences Research Council (HSRC)
Investigation into Education, entitled Provision of
Education in the RSA.

The HSRC was requested by the Cabinet of the South African
government in June 1980 to conduct an 'investigation into
all facets of education in the RSA'.(1) It is widely
believed that persistent and often powerfully-expressed
dissatisfaction displayed particularly by black communities
since 1976 is the origin of the Cabinet's request for the
Investigation. As the articles printed here indicate, there
are other considerations which have been influencial in
determining the Government's decision to reconsider the
future of education in this country.

Professor JP de Lange, Rector of the Rand Afrikaans
University, was appointed research leader and chairman of
the Investigation, the findings of which are now popularly
known as the 'De Lange Report'. Since publication of the
Report in July 1981, there has been widespread discussion of
its proposals, particularly after the Cabinet's response to
that Report in its Interim Memorandum of October 1981.

In that document the Government accepted the Report's eleven
principles for the provision of education 'subject to points
of departure' like the re-affirmation of the 'Christian and
broad national character of education' as contained in the
National Education Policy Act of 1967; the principle of
mother tongue education; 'that each population group should
have its own schools'; and that the 'constitutional frame-
work within which they are to be implemented' will largely
affect decisions taken about the Report's recommendations.
(2)

1

The Government provided opportunity for 'official and recognised education bodies' to submit responses to the Report before the end of March this year, whereupon two large conferences were held: one in Grahamstown in February (3) and one in Bloemfontein in March. The latter is discussed in the article by Johan Muller in this issue of Perspectives.

We have been able to publish only four articles within the limited size of this journal. Other material received on the topic of the De Lange Report can be included in future ordinary issues, three of which will appear later this year.

As the first issue will appear in July, the provisional deadlines for the second and third issues are:

Volume 6 number 2: 20th July

number 3: 20th September.

TRAINING FOR CAPITAL: DE LANGE REPORTS (1)

Linda Chisholm

1   Introduction

The Commission of Inquiry undertaken by the Human Sciences
Research Council (HSRC) was set up to investigate the
'crisis' in South African education and to put forward
recommendations on how to solve it. Both the role of the
Commission in the political economy of South Africa and the
nature of the educational crisis have to be examined to
understand the implications of the recommendations made by
de Lange's HSRC Commission (2). Although there has been
much publicity given to the government's rejection of the
report, there is evidence:

(a) that some of the recommended changes are completely
compatible with state policy and are, indeed, already being
implemented, and

(b) that the significance of the report lies as much in its
effects on the educational system as on the nature and scope
of political struggle in education.

To untangle the different elements of the report and to
understand its significance within the totality of society,
one needs to find out who is talking through it, ie which
class interests it represents, what the political objectives
of these are, and how they are represented in the report.

The overriding concern of the report lies with the so-called
mismatch or incompatibility of the economy and society, as
compared to the skills made available through the current
education system. This theme of 'manpower shortages' and
the role of education in meeting such skill shortages is
reflected in capital's many speeches and reports on the
question. From the Urban Foundation to Manpower 2000, from
Anglo-American to Barlow Rand, the argument has consistently
been made that unless South Africa's education system is
restructured, 'economic growth' will not be maintained.
Calls for reform have been made so stridently over the last
year that the relationship between manpower needs and the
role of education in meeting these has been accepted as
obvious, involving 'common sense'. This was expressed by
Mike Rosholt, chairperson of the giant Barlow Rand group, in
the following way:

> Where knowledgeable people call for a common
> educational system for all race groups, they are
> expressing the view that there is no other way

                    that the educational system will be able to provide
                    the level of skilled manpower we need in the future -
                    indeed, what we require now. (3)

It is accepted that 'economic growth' (or 'economic
emancipation' as the report phrases it) demands a non-racial
system of education, and that it is only 'politics that is
blocking reform'. (4) It is in this way that government
rejection of the report has been interpreted: as a typically
narrow, backward response to a 'revolutionary' proposal for
the overhaul of the education system.

At the outset, we need to understand the reality of 'skill
shortages' a little better. Where do they lie? What is
their significance?

Statistics on the question of the shortage of skilled labour
abound. At a Manpower 2000 convention in November 1980, for
example, it was estimated that 700 000 'fully-trained
workers' would be needed by 1987 in all sectors of the
economy. But, as Charles Meth has pointed out, 'statistics
on skill shortages...share an important characteristic and
that is their almost complete unreliability'. Irrespective
of whether there is a shortage or not, 'it is obvious that
....a persistent belief that there is such a thing,
particularly a belief that such shortages are widespread, is
likely ultimately to have important political consequences'.
(5)

Although there might not be clarity on whether there are any
'real shortages', and if there are in what sectors of the
economy these lie, it is true that the development of
monopoly capital in South Africa and the correspondingly
sophisticated technology that has been put to use in the
production process has, amongst other things, introduced a
new industrial division of labour between semi-skilled
operatives on the one hand, and technical supervisory
labour on the other. This has replaced the previously
dominant unskilled/skilled division of labour on which the
South Affican economy has historically rested. This process
has also marked a decisive shift away from the reliance on
cheap, unskilled migrant labour towards the consolidation of
a stable, semi-skilled workforce.

How such a working class is to be reproduced has become a
much-debated question for both capital and the state in
recent years, and its partial resolution has found
expression in commissions of inquiry such as Wiehahn,
Riekert, and now the de Lange report. The resolution of
the problem from capital's point of view has become urgent,

particularly in the light of recent worker and student
struggles. The 1976 uprising and the boycotts of 1980 have
revealed a profound crisis in the educational structure.
For future workers to be reproduced with the required level
of skill, and with the requisite societal values, it has
become imperative for their consent to be won, and for at
least some of their demands to be met - even if in changed
form.

It appears that the HSRC report represents an attempt to
restructure education from this perspective; that this
restructuring aims to prepare a section of the working class
for a changed division of labour and to give an appearance
of reform. As Dr PJ van der Merwe of the National Manpower
Commission has said,

> Structural change in the economy demands a different
> kind of labour force. The growth of giant high-
> technology firms, and of manufacturing and public
> services, demand both skilled black labour and a
> higher level of general literacy....(T)he de Lange
> proposals (which I helped frame) are tailored to
> produce such a workforce. (6)

It is not co-incidental that this semi-skilled workforce is
one which is to be 'rewarded' for its pains with section
10(1)(a) or (b) rights, recognised unionisation, etc. As
Peter Buckland has written, these are mechanisms 'whereby
sufficient blacks can be incorporated into high-income
positions to maintain the present balance of power'. (7)
This is a very important dimension of the Report, not
properly explored in this paper.

It is important to bear in mind that the extent and nature
of reforms in education depend to some extent on the balance
of forces within the state itself; this balance of power
between contending interests determines whether and how
changes will take place. It is thus of importance to look
at the class basis of the report, the balance of forces
within the state, and the question of whether the
recommendations were formally rejected by government because
of a narrow response.

2   The Class Basis of the Report

The Main Committee of the HSRC was headed by Professor
de Lange, rector of the Rand Afrikaans University (RAU).
His commitment to a process of restructuring or 'reform' was
well known before publication of the recommendations. The
committee consisted of some twenty six members drawn either

directly or indirectly from government-supporting educational
institutions, and from 'private enterprise' in the shape of
Anglo-American. Indeed, the composition of the Main
Committee reflects the alliance only recently consolidated
in the broader political sphere, viz that between the upper
echelons of state power, and monopoly capital. It is an
alliance which indicates a shift in the balance of class
forces in South Africa, involving the emergence of a
distinct state element representing the interests of
monopoly capital. In a recent paper, (8) Dan O'Meara has
shown how the Information Department scandal associated with
Muldergate allowed a reformist element to gain dominance in
the state, reflected in the coming to power of PW Botha and
his generals. Botha then appointed a new Minister of
National Education, Gerrit Viljoen, and it was Viljoen's
associate at RAU, de Lange, who was appointed to head the
Commission.

The political interests of this new alliance in the state
has found expression in what some have called 'total
strategy'. Not much need be said of this here, except that
it includes an attempt to win over and co-opt a small number
of blacks to the 'free enterprise' system. This total
national strategy was intended to work in all spheres of
society: thus, Wiehahn and Riekert proposed that certain
restrictions on africans be lifted, harsher forms of
discrimination be relaxed, and that trade unions be
incorporated into the industrial relations system. This
gave an impression of reform, but at the same time
rationalised and streamlined control of the working class.

The HSRC commission of inquiry into education fits into this
broad pattern. It involves an attempt to win the consent of
the governed through the apparent deracialisation and reform
of education, while at the same time streamlining and
restructuring the education system. This aims at the more
adequate training of a potential workforce for an altered
division of labour involving changing skill needs.

It must be borne in mind that the state is a unity of
contradictory class interests, involving struggles for
dominance by different fractions of capital, changing
alliances, and altering balances of power between contending
interests. The current alliance between big capital and a
certain group in the state does not mean that conflicts
within both state and National Party have ceased. Indeed,
there continues to be a fierce struggle for power between
the wing of state power represented by Treurnicht, and that
represented by Botha and his generals. It is therefore not
surprising that Minister of Education Viljoen trod very

carefully when the report was published attempting not to convert the recommendations into a terrain of struggle between contending interests within the state.

As Viljoen notes elsewhere, nothing in the report actually contradicts the principle of segregated education, and some of the recommendations and all of the principles have in fact been accepted by government. (9) The apparent rejection of the report by government immediately after its release must be seen in a context where the Botha faction is not fully assured of its dominance in all the state apparatuses, and in the light of what is actually happening within educational restructuring.

To all intents and purposes, many aspects of the report are already being implemented. In the statement mentioned above, (10), Viljoen said that steps were being taken to create the South African Council of Education which the report suggests should advise the Ministry of Education. Moreover, there is evidence that schools in Soweto are being transformed in the manner recommended by the report: capital is playing a large part in the provision of vocational education, and in many schools plans are under way for converting them into technical and commercial high schools. (11) Decentralisation of powers to regional bodies dealing with salaries and appointments is also taking place, and negotiations for the establishment of a statutory teachers' negotiating body are under way.

The HSRC report is thus linked into the interests of the ruling alliance, and although its recommendations were formally rejected, some are already being implemented. But it should be recalled that the inquiry was set up in the midst of the 1980 education crisis, when school boycotts spread to both large and small towns. To argue that educational restructuring is simply a response to technological   changes, or to changes within the ruling class, is to neglect the intense struggles which gave rise to the restructuring progamme. This involved struggle and organisation by workers in the form of strikes, stay aways, strong union organisation, and by students in the uprisings of 1976 and 1980. There can be no understanding of the dynamics at work here without an understanding of the way in which processrs are structured and effected by the actions of both the working and popular classes. To some extent, then, the HSRC report must be seen as a response to the demands put forward in struggle. (12)

However, the HSRC recommendations attempt to come to terms with these demands within the context of a capitalist and

racist division of labour - and thereby co-opts and
transforms the demands within its own frame of reference.

Priorities and Financing of Education

As mentioned above, there is an extremely close connection
between the recommendations of the HSRC, and interests of a
more explicitly monopoly capitalist origin. To see this, a
comparison between the de Lange Commission and SYNCOM, a
'think tank' for capital which has done work for General
Mining and on subjects involving 'constitutional models for
change in South Africa', is of value. This comparison
covers priorities and financing, and the structure and
content of education.

For de Lange, 'the priorities (of education) should be
determined in the context of the current and expected
manpower needs of the country'.(p 13)

> Seen from a socio-economic point of view, it is
> recognised that the demand for education, explicitly
> or implicitly formulated by individuals or groups
> does not always take practical realities into
> consideration. In the RSA all population groups
> are to a greater or lesser degree guilty of having
> unrealistic expectations of education, with the
> result that to a large extent the present system
> ....has not been able to succeed in creating harmony
> between the human material it produces and society's
> manpower needs (p 71 - emphases added).

For SYNCOM, the education system must be 'linked to the
realities of future society and the demands of economic
progress'. (13) Education has been 'irrelevant in
promoting development and stifles, rather than stimulates,
entrepreneurship, the lifeblood of free societies'.
Moreover, 'black demands for a massive input of money to
achieve white-type education and facilities for their
children are economically unrealistic and will serve neither
society nor the black community in the best possible way'.

While the HSRC is undoubtedly far more euphemistic than
SYNCOM, and masks its intentions more carefully, for both
the priority is maintaining economic growth in its present
form.

This highlights the unproblematic and technical way in which
the HSRC report treats both the economic development of the
country and the development of the education system.
Individuals are regarded as factors of production in an

8

education system whose 'natural' purpose is meeting the
manpower needs of capital which, in turn, are defined as the
needs of both pupils and workers. Phrases such as
'realistic' and 'normal' abound in the report; these all
appear to relate to an analysis which sees South African
economic development as neutral and conflict-free. From the
report it would appear that the investigation was instigated,
not in the context of a crisis for the state and capital,
but because of 'disharmonisation' between the educational
structure and the manpower needs of society.
Disharmonisation is reflected in 'drop-out' rates from
schools and the quantitative differences between South
Africa's 'distinct' education system. The solution put
forward to the problem of disharmonisation is a technical
one, not a political one; the provision of an education of
'equal quality' for all.

Education of equal quality means simply equal but separate
education, with equal resources to be spent on the different
parts of the education system. One is urged to be
'realistic' about the state's financial contribution. There
is to be parity of expenditure, but 'it is inevitable that
realistic norms be set to determine the financial needs in
respect of provision of education' (p 72). These norms are
never spelt out, but it is assumed that they are the norms
of manpower development.

What is recommended in terms of financing of education is
that state resources be shifted to the first 6 years of a
child's schooling, which should be 'equal and compulsory'
for all. Thereafter, if the pupil continues through to
secondary (formal) education, s/he should be financed by the
'individual and the community to supplement the state's
contribution', is by his/her parents. If the pupil on the
other hand proceeds to vocational education, this will be
largely the financial responsibility of capital. What this,
in effect means, is that wealthier communities will be able
to afford and therefore have access to largely unsubsidised
secondary schooling, while the children of the working
classes will be channelled into technical and vocational
education (heavily subsidised by capital).

The reduction in the length of formal education implied in
the recommendations for the majority of pupils, and their
channelling into technical education, suggests a shift in
the criteria of differentiation and selection rather than an
end to differentiation. (14) Thus a meritocratic education
is envisaged whereby selection takes place according to
social class rather than race, and is legitimated by an
ideology of 'parity for all' and 'equality of opportunity'.

In this regard, it is important to note that amongst the values identified by SYNCOM is 'the ability to cope with failure and to learn from it'. Failure, as in all meritocracies, must be seen to lie with the individual and not outside of him/her. The individual must learn to cope with failure, not learn to change the social circumstances that produce it!

4   Structure and Content of Education

A highly-differentiated, vocationally oriented education structure is envisaged by both the HSRC and SYNCOM. South Africa's needs for a differentiated system of education is supposedly derived from 'scientific research':

> The integrated curriculum....is regarded in many countries as the ideal educational model. However, nowhere is it possible to obtain confirmation that integrated curricula are the answer. It is evident from the research that attention should be given to the establishment of a national policy for differentiated curricula. This differentiation will differ considerably from the current system of differentiation (p 41).

A note regarding differentiated education is useful here:

> There appears to be an assumption that the class structure is immutable, and this assumption is fuelled by the vicious cycle effect of providing an education which trains people according to their 'opportunities in life'... (It) takes as given the problematic notion that working class children, or black children, or minority group children, have restricted futures. By accepting this without question, and providing a limited education to match the restricted future, differential education ensures the continuation of the cycle. Bantu Education is par excellence an example of this. But it is worth noting that the removal of (this) education does not imply equality ....if it is not accompanied by the removal of differential socio-economic conditions and values... ie you can't have equality...without a good deal of equality of condition. (15)

To compensate for this inequality of condition, the commission predictably did not address itself to broader inequalities - that was not its mandate, and it would be petty to quibble over this. Rather, it proposes a form of pre-basic education (pre-primary), which is to prepare kids

for school. The entire restructured education system is
also designed to have various other compensatory programmes.
But these programmes can nevertheless not begin to deal
meaningfully with wider socio-economic inequalities. As
recent research in England, for example, has shown,
'education cannot compensate for society'. (16)

.Both SYNCOM and HSRC recommend a 3-phase formal education
structure, the end of the first phase leading to either non-
formal education or academic education. The basic phase is
to last for 6 years while the post-basis (non-formal or
academic) is to last for another 3 years. Streaming at all
levels is to ensure that there is no 'wastage'. The basic
phase is to be free and compulsory. The Commission has some
nice semantics regarding compulsory education: education is
to be free and compulsory for the first 6 years; thereafter
the pupil must be engaged in compulsory learning but not
necessarily 'education' for another 3 years. In other words,
students can be streamed into technical education from the
age of 12.

HSRC and SYNCOM also conceive of the school as a Community
Learning Centre (CLC). Says de Lange, 'our redefinition of
a school: it will be a community learning centre which will
open up its facilities after hours for the community'. (17)
And, at the heart of SYNCOM's new education system, reports
The Star newspaper, is the Community Learning Centre, serving
4 target groups. These involve: headstart (compensatory)
programmes, 10 years compulsory schooling, ongoing
educational programmes, and socio-cultural programmes for
the community.

These are all to take place within the CLC to 'guarantee
maximum use of a facility 7 days a week instead of the
present uneconomic 7 hours a day, 5 days a week'.

Here we see a rationalisation of the school facilities in a
way in which the student will appear to have 'a lot more
education', a 'greater number of choices'. However, the
number of choices, and the increase in the amount of
education available should not blind us to the fact that for
the worker this does not amount to democratisation. The
manual worker can now become a skilled worker, but he still
does not have control of the work process, and his education
does not put him in a general condition to plan and make
decisions. (18)

An indication of the content of this type of education is to
be found in the broad specifications given by SYNCOM that

11

There will have to be a shift away from communicating
what there is to know in the expectation of its being
relevant at some future date, towards learning the
means of finding out what one wants to know when the
need arises. This means learning 'informatics' - how
to learn, unlearn and relearn and how to use the
information process.

In other words, education is to make the worker a better
worker by making him/her more adaptable. Technical education
is to prepare the worker for production with skills that can
be flexible and built on. As a teacher of on-the-job
training described this kind of education,

You've got the flexibility to work for 500 different
bosses: but this education ties you to the firm, and
it does it in such a way that you can never escape.
In a sense, you become a better slave. The worst,
though, is that because they've given you a little
more knowledge, you're that much higher up than the
next man down - so you're also a more loyal slave.
(19)

There is thus a split into formal and non-formal education,
academic and technical education. Non-formal education
appears to be directed towards providing cheap adult
education, while technical education appears to be designed
to produce the engineers, technicians and supervisors which
seem to be in such short supply (20). It is clear that if
working class education is being upgraded to technical
education, then the contribution of capital in the funding
of that education will determine, to a large degree, the
content of that education. The level of 'individual'
contribution to the formal structure for academic education
in the post-basic phase will also be an important
determinant in ensuring that formal education will be open
only to certain social classes.

5   Education as an Agent of Social Change

De Lange, in various public statements, has asserted that
'the present system of education is far too academic', and
that 'it is important to realise that formal schooling is
not necessarily the effective instrument for bringing about
social change'. He has also claimed that the greatest
misconception to be overcome is that kids learn best
through compulsory schooling, but that they learn best
on-the-job. Therefore, it is argued, 'non-formal education
should become an indispensable part of the planned provision
of education in South Africa'. Interestingly, he places

12

South Africa in the same category as newly-independent countries, arguing that experience here has proven that 'formal education slows down economic emancipation and political development' (p 19).

SYNCOM similarly argues that 'formal education has not narrowed the income between rich and poor as planners indicated', that it is, in fact, 'irrelevant to development, that more than half all new jobs in future will have to be in the informal sector....This will require totally new education targets and ways of continually learning outside a formal school environment'.

Thus, both the HSRC report and SYNCOM argue for a highly-differentiated system of education in which non-formal (technical and vocational) education will play at least as important a part as formal education - especially 'for blacks, coloureds and Indians' who are the target group to be trained for places in the economy created by a changed division of labour and where there is a 'shortage'.

It is an essential tenet of liberal thought that education will lead to social change. In South Africa liberal educationists such as Hoernle and Malherbe have argued that education, through providing skills and knowledge (which in itself is assumed to banish ignorance and prejudice) has an egalitarian, liberalising effect. In the 1950s and early 1960s, modernising developing strategies in Africa also placed educational provision at the centre of development programmes. By the mid-1960s, however, in the light of endemic underdevelopment and continued political instability, the relationship between education and social change came to be questioned.

For some analysts formal education is now seen to be a manipulative instrument for perpetuating class or racial dominance since it selects and trains an indigenous class of collaborators. Education, rather than the answer to development, is now placed at the centre of an explanation for dependency and underdevelopment. (21)

In the Latin American context, Ivan Illich (22) argued that the solution lay in the 'deschooling of society'; that schools are the source of all social ills and that children should, because they can, learn through experiencing the world at an early age. Thus, by linking education with active work, education will be an active, liberatory process.

If we follow Illich, (whose criticism of capitalism amounts to a critique of consumerism and passivity rather than its

class relations and resultant inequalities, hierarchy and alienated work), children will be channelled into a capitalist work-environment without the intermediate schooling process. For Illich it is not the work-environment and lack of control that is at issue here - it is the schooling. If the problem is social inequality, hierarchy and a capitalist division of labour, then Illich's solution is no solution at all. The de-schooling of society will address inequality even less than the schooling of society. Linking education with active work in the capitalist context becomes a surer means to subordination.

It is interesting to note that de Lange adopts Illich's argument that children learn best on the job (not an entirely incorrect or even undesirable option within changed social relations) to justify their early extrusion from school into restricting, vocational, on-the-job training. It is clear that de Lange is co-opting an argument from a radical education tradition, though not a revolutionary one, for his own very different purposes. The bankruptcy of Illich's proposals within a capitalist society is thus seen when we see the consequences of it here.

It is also important to note the earlier argument that 'education cannot compensate for society'. In this context, de Lange argues by a strange sleight of hand that while formal education will not lead to social change, technical education is 'the key to a better life, the gateway to more money and the power exercised by whites' (23) for blacks. While the liberal illusion that educational change on its own is able to lead to social change has long since been discredited, the report uses a part of this argument and distorts it to justify further differentiation. For the HSRC Commission, formal education will not lead to social change; technical education, however, will!

As mentioned earlier, de Lange must be seen in the same light as the reports of the Wiehahn and Riekert Commissions - a response to the crisis of accumulation of capital and intensified class struggle, designed to win worker consent with the appearance of reform but simultaneously rationalising control and dividing workers.

We have seen how technical education can be introduced on a large scale and how this can appear to be providing both more and better education while at the same time stream-lining the operation of the education system. This will ensure that pupils leave school very early (when seen in the context of the leadership of resistance in schools being drawn from the older age group, this can also be viewed as a

14

tactic for pre-empting such resistance); it will also ensure that social selection takes place not on the overt basis of race, but on the basis of 'wealth' and 'merit' - since all education, albeit different kinds of education, will be 'of equal quality'.

It can also be noted that:

(a)   equal funding and parity of facilities alone will not create either an equal or a non-racial education system;

(b)   changes in the education structure alone, without corresponding changes on the factory floor, are hardly 'revolutionary';

(c)   'politics' is not blocking 'reform', in the sense understood by the HSRC commissioners: reform itself is political in the educational as much as in any other sphere.

But we also need to look a little more closely at technical education: the education that will provide workers with the technical competence, in some cases, but not the tools for understanding and controlling the social forces which determine their lives; workers will thus be rendered more dependent on the factory or firm as a whole, and therefore on capital. They will be technically subordinated to the 'uniform motion of the instruments of labour'. To grasp this notion, it is necessary to say something about the division between mental and manual labour.

6   The Division of Labour

The division between mental and manual labour makes its first appearance with the emergence of private property. As a consequence of the alienation of the direct producer from his/her product, there occurs the concentration of intellectual activity at one end of industry, and the purely practical activity of the workers at the other. This is a separation between theory and practice which is reflected in divisions between classes, and within education in class society. Marx, quoting William Thompson in Capital, writes

The man of knowledge and the productive labourer come to be widely divided from each other and knowledge, instead of remaining the handmaid of labour in the hands of the labourer to increase his productive powers... has almost everywhere arrayed itself against labour... systematically deluding them and leading

15

them (the labourers) astray in order to render their
muscular powers entirely mechanical and obedient. (24)

This separation of the intellectual powers from manual labour
is finally completed by modern industry. The workmen becomes
a 'living appendage of the machine'. Such work in which s/he
is engaged, 'does away with the many-sided play of the
muscles, and confiscates every atom of freedom, both in body
and intellectual activity'. Work is organised and fragmented
in such a way that the worker loses all control over the
production process.

Increasingly, with the emergence of monopoly capital, there
has developed a class of engineers, scientists, technicians
and supervisory workers whose job it is to co-ordinate work
(mental labour) and to control workers. Even here, though,
as Bowles and Gintis write,

    The compartmentalisation of white-collar skills (is)
    an essential aspect of capitalist 'divide and rule'
    strategy for the control of the labour force. Even
    in well-paid and high-status jobs the worker's
    discretion and participation is increasingly limited.
    (25)

The worker is thus kept ignorant of the process of production
and social relations are mystified for him/her. S/he is
kept ignorant of the political, economic and social forces
that determine the organisation of production and life
itself. This is a product of the fragmentation and
specialisation of jobs, and the hierarchical division of
labour in capitalist society.

An educational strategy that aims to overcome this division,
that attempts to restore the physical, cultural, intellectual
and spiritual integrity of the worker must then be one that
restores to the worker the knowledge and power of decision-
making and control. Such an education must combine mental
and manual labour, must embrace both technical education, an
education to understand the process of production, and an
education which will enable the worker to understand social
relations. The aim of 'polytechnic' education must be the
fully-rounded, politically conscious individual able to take
control of his/her life and work.

Technical education, it seems, is a bastardisation of this.
Within capitalist social relations, technical education
provides skills of a kind that separate the tasks of
conception and execution, thus furthering the mental/manual
division of labour which reduces the worker to 'an appendage

16

of the machine'. It is the kind of education likely to
leave the worker more vulnerable than before. Technical
change is a constant feature of capitalist development.
Equipped with specific skills the worker can be made
redundant in the case of technical change and replacement.

As long as technical education is part of the maintenance
of capitalist social relations, it can do little more than
further degrade the worker.

7   Democracy and Control in Education

There is one further aspect to consider, and that is the
question of educational management which, says the HSRC
report, can be regarded as 'the philosophy and practice
of decision making, while effective teaching and learning
are the ultimate aim of educational management' (p 87). As
such, a 'total curriculum strategy' is necessary (p 41).

A 3-tier system of educational management with strong,
'built-in structures and procedures for participation,
consultation and negotiation at each level, ensuring that
all the people and interests concerned have a 'say' and can
influence both educational policy and practice' appears to
embody the demands of students in their struggle for
democratic education. A relatively decentralised structure
of education is proposed with one ministry of education
served by a South African Council of Education to provide
broad national policy. The second level is based on
regional educational authorities which would be served by
different bodies for curriculum development and examinations,
adult and non-formal education and education planning. The
third level is based on the local school district 'that
could make up units of management smaller than the "region"
or "sub-region";...' Here key roles are to be played by
principals and circuit inspectors in reform.

Here more than anywhere else, the nature of the report is
exposed. Demands by students for a democratic education
have been linked to the demand for a democratic society. In
the present context, within the present dictates of power
and control, the SACE can only play the role of a
President's Council, a single Ministry of Education can only
involve the streamlining of operations, the central role of
principals and circuit inspectors can only imply continued
hierarchical control.

The language of the modern corporation is used throughout
the HSRC report, and provision for an 'effective system of
education management' is considered one of the most

17

important preconditions for the restructuring of education.

The monopoly stage of capitalism is characterised by an immense growth in the scale of management operations - the functions of management are broadened in the modern corporation in such a way that different functional departments concentrate specific aspects of the management function in them. The proliferation of administrative units and subdivisions within the entire corporation involves the reorganisation of management into 'a complex of staff organisations' which 'represents the dismemberment of the functions of the enterprise head'. The purpose of this is control, which is an essential feature of management throughout its history.

When we look at the proposed education management structure we see the same kind of proliferation of planning and administrative bodies which essentially concentrate in themselves functions previously undertaken and performed by the individual teacher or school, viz those of decision-making and control. This involves the setting up of new bodies for 'curriculating'; the creation of 'curriculum specialists'; the creation of a research body, the results of which are to be passed on to 'curriculum planners'; the establishment of bodies to co-ordinate curriculum design; evaluation and development 'with related services such as evaluation, examinations, certification and educational technology'. This will in turn lead to the creation of subsections for examination and certificating bodies, educational technology units, curriculum packages, etc.

Some of the demands for which students have laid down their lives have been conceded in the proposals of the HSRC report - parity in expenditure, one national education system. But these have been proposed by the de Lange Commission in such a way that ultimate control is maintained in the interests of capital. As such, any restructured education system will involve formal equality - but continued separation; it will be controlled from above rather than below; and it will serve the needs of the monopoly sector of the capitalist economy, rather than the interests of the working class.

Notes

(1) This article was written very hastily and there have already been many useful comments and criticisms. I would appreciate more feedback to clarify the issues.

'A PROGRAMME TO ATTAIN EQUAL QUALITY FOR ALL INHABITANTS': SOME COMMENTS

Owen van den Berg

Different things to different people

The debate about "educational equality", "equality of educational opportunity", "education of equal quality", or any other permutations of the concept has tended to flounder because of the lack of a shared understanding amongst those involved in the debate about the meaning of the concept. Worse, still, is the tendency for "equality" to be deemed as self-explanatory, an obvious thing, as on bumper-stickers. JR Lucas reminds us, however, that "Opportunity, like Equality, is a treacherous concept, and Equality of Opportunity doubly so". (1)

Educational equality in South Africa

The concept has no long history in South Africa. The Report of the Welsh committee on Native Education, an engagingly frank report if there ever was one, said

> From the evidence before the Committee it seems clear that there still exists opposition to the education of the Native on the grounds that (a) it makes him lazy and unfit for manual work; (b) it makes him 'cheeky' and less docile as a servant; and (c) it estranges him from his own people and often leads him to despise his own culture. Those who bring forward such criticisms in some cases add that it is not to education as such that they object, but to the wrong (present) type of education ... the aim that most of such critics have at the back of their minds is that we must give the Native an education which will keep him in his place. What that 'place' actually is, was not clearly formulated by anyone... Some seem to think of 'place' in the geographic sense ... others seem to think of 'place' in terms of status. (2)

Dr Verwoerd, the doyen of apartheid, had no problems with this treacherous concept : it was a Bad Thing to be avoided at all costs. "When I have control of Native Education", said he, "I will reform it so that Natives will be taught from childhood to realise that equality with Europeans is

21

not for them." Government policy under Verwoerd and subsequently was clearly and proudly aimed at education that was both separate and unequal.

The brief given to the HSRC Investigation seemed to indicate a significant move away from this position to one of separate and equal education, for the Prime Minister requested the HSRC to come up with "a programme for making available education of the same quality for all population groups." He also acknowledged that people had the right to object if educational facilities reflected policies of inequality based on racial classification, for he stated - if the English press is to be believed - that

> The government accepts that justifiable grievances and a backlog regarding the provision of education exist in the coloured community. I shall make it my personal task to ensure that these grievances and the eradication of the backlog be given priority treatment. (3)

The debate on equality

The thrust towards educational equality has occurred on three major fronts: in Western Europe, where it is associated with the movement towards the comprehensivization of schooling; behind the Iron Curtain, where the various states have consistently declared themselves in favour of equality of all kinds; and in the USA, where the issue arose out of the Civil Rights movement and attempts to destroy racial segregation.

The question that arose, perhaps surprisingly slowly, was, in what sense are all men - or, rather, persons - deemed to be "equal", so that they may rightfully expect "equality" in education? Lucas says, rather wryly, that

> To speak of equality in education is rather like speaking of equality in love. Young men sometimes wax indignant about the unfairness of their lot, and say there ought to be arrangements whereby the available girls should be shared out equally, so that everyone should get his whack; or, more sophisticatedly, that the most desirable girls should be made to bestow their favours on egalitarian principles, so that the total female talent be fairly distributed and nobody be deprived of his rightful need of femininity. (4)

The idea that all men are created equal is, however,

22

dismissed by Eysenck as "politically impossible, philosophically meaningless, and biologically absurd". (5) Lucas is, again, wry when he says that "... if we ... say that all men are equal in respect of their humanity, it is easy to forget that this is a mere tautology, misleadingly expressed ..." (6) He demonstrates the danger of the argument by substituting "numbers" for "men", in the equation :

> All numbers are numbers.
> Therefore all numbers are equal in respect of numberhood.
> Therefore all numbers are equal (7)

On the other hand, Shylock has a point when he says :

> I am a Jew. Hath not a Jew eyes? Hath not a Jew hands, organs, dimensions, senses, affections, passions, fed with the same food, hurt with the same weapons, subject to the same diseases, healed by the same means, warmed and cooled by the same winter and summer, as a Christian is? If you prick us, do we not bleed? If you tickle us, do we not laugh? If you poison us, do we not die? And if you wrong us, shall we not revenge? If we are like you in the rest, we will resemble you in that. (8)

The argument for educational equality does rest on a particular understanding of ways in which all persons are equal, are entitled to certain residual rights : "It is difficult to fight equality", says Lucas, for "Egalitarianism is not so much a doctrine as a temper of mind". (9) It has also strong Christian buttressing - perhaps surprisingly in a country where the Government claims to be Christian while it discriminates - maybe most tellingly epitomised by a verse never quoted by those seeking theological justification for apartheid, Galatians 3:28, "So there is no difference between Jews and Gentiles, between slaves and free men, between men and women; you are all one in union with Christ Jesus".

Given this "equality", all persons are entitled to an equal allocation of whatever it is that is to be allocated, unless there are factors that legitimately allow for an unequal allocation of resources. Each person, says Mary Warnock, "should be treated as having a right, according to the rule ... each gets what the rule allows". (10) - that is, equality-in-the-light-of-justice, or what the De Lange Report entitles "distributive justice".

23

On this basis, the formulation of the rule becomes crucial.
In educational terms, there are legitimate reasons for
educational differentiation just as there are illegitimate
reasons for such differentiation. Entwistle provides the
following checklist :

> ... equality of educational opportunity implies that
> no-one should be prevented through social or economic
> impediment from getting the best possible schooling
> from which he can benefit. Irrelevant matters to do
> with social class, economic status, nationality, sex,
> ethnic origin, religious affiliation, race or
> geographical location should have no bearing upon
> access to schooling ... demonstrable differences in
> intelligence, achievement, talent, interests or tastes
> may justify differential educational provision.
> Everything hinges on this distinction between
> differences which are educationally significant and
> those which are educationally irrelevant. (11)

To sum this up, educational diversity based on educationally
irrelevant factors is discrimination; educational diversity
based on educationally valid factors is differentiation.
Education may and must differentiate; education may not
discriminate. And that is the danger of "equal education":
it may ignore the need for differentiation because of the
slogan of "equality", and so may discriminate by seeking to
treat all in the same way. Conversely, we have a Government
which discriminates while it claims to be differentiating.
Everything hinges on the distinction between differences
which are educationally significant and those which are
educationally irrelevant.

Particularly in the American experience, strategies for
achieving educational equality went through various phases.
The first was equality of access - that all persons should
be allowed to enter educational institutions : compulsion
was an important aspect of this approach, as was the idea
of "free" education. This, however, revealed a rather
primitive grasp of an economic concept - "free" education
in the formal sense does not allow for the "costs" to the
family of having the child at school and not at work.
Equality of access was really based on what has come to be
known as the "input" model of educational equality - that
all educational institutions of a particular level or type
of education should have basically equivalent facilities
often represented in highly quantifiable terms. This
strategy for achieving equality ignores the variable
"inputs" to the school by each child; what is more, says
Coleman, "equality defined according to inputs is

24

inattentive to the effects of schooling which is the whole purpose of public schooling". (12)

The failure of the "input" model led, then, to an "output" or "effects" or "outcomes" model of educational equality, which recognised that the inputs of individuals are unequal, and that the school must correct or compensate for these deficits as people should not suffer educationally for factors beyond their control. Rawls termed this the "principle of redress" :

> ... undeserved inequalities call for redress, and since inequalities of birth and natural endowment are undeserved, these inequalities are somehow to be compensated for. (13)

This egalitarian argument tended to be linked to the "human capital" argument, which held that educational expansion constituted an investment that would result in economic growth via the creation of a better-educated, skilled and adaptable workforce. Attempts were made to calculate percentage returns achieved in terms of GNP on earlier investment in education; nobody postulated the reverse argument that it was only in circumstances of greater economic prosperity that countries could enjoy the opportunity of squandering more money on schools.

The difficulty with the "output model" is, as Entwistle points out, that

> the notion of equal results or benefits is very difficult to concretize educationally or socially. Equality of outcomes implies that in some sense people should become equal as a result of their schooling ... what would count as equal learning for the school population within a given society. (14)

One attempted solution was posited by Green, who argued that:

> It can be set down as a kind of definition that any society will have attained a condition of equal educational opportunity when firstly the range of the distribution of benefits and secondly their distribution within that range is approximately the same for each relevant social group within the student population ... not ... that everyone must reach the same level of attainment. It means only that the range of achievement and the distribution within that range should be about the same for each social group. (15)

25

inattentive to the effects of schooling which is the whole purpose of public schooling". (12)

The failure of the "input" model led, then, to an "output" or "effects" or "outcomes" model of educational equality, which recognised that the inputs of individuals are unequal, and that the school must correct or compensate for these deficits as people should not suffer educationally for factors beyond their control. Rawls termed this the "principle of redress" :

> ... undeserved inequalities call for redress, and since inequalities of birth and natural endowment are undeserved, these inequalities are somehow to be compensated for. (13)

This egalitarian argument tended to be linked to the "human capital" argument, which held that educational expansion constituted an investment that would result in economic growth via the creation of a better-educated, skilled and adaptable workforce. Attempts were made to calculate percentage returns achieved in terms of GNP on earlier investment in education; nobody postulated the reverse argument that it was only in circumstances of greater economic prosperity that countries could enjoy the opportunity of squandering more money on schools.

The difficulty with the "output model" is, as Entwistle points out, that

> the notion of equal results or benefits is very difficult to concretize educationally or socially. Equality of outcomes implies that in some sense people should become equal as a result of their schooling ... what would count as equal learning for the school population within a given society. (14)

One attempted solution was posited by Green, who argued that:

> It can be set down as a kind of definition that any society will have attained a condition of equal educational opportunity when firstly the range of the distribution of benefits and secondly their distribution within that range is approximately the same for each relevant social group within the student population ... not ... that everyone must reach the same level of attainment. It means only that the range of achievement and the distribution within that range should be about the same for each social group. (15)

25

But, as Entwistle says, "From a humanist point of view it is not clear why vast inequalities between individuals within social groups should be more acceptable than similar inequalities between human beings across social groups. (16) It is really a matter of determining priorities when faced with two injustices.

If we return to the principle stated earlier, that each person "should be treated as having a right, according to the rule ... each gets what the rule allows" - equality as fairness - then we can argue that two groups deviate from the norm and have the right to an unequal portion of the education cake. First, just as hospitals are expected to devote much attention to the seriously ill, so we might accept that the "educationally deprived" have a right to extra attention, an assumption that spawned vast numbers of "compensatory" education programmes in the USA and elsewhere. Similarly, we could argue that those who display the greatest potential, ability, flair, etc have the right to unequal treatment - an argument that links conveniently with High Level Manpower arguments, as in Entwistle's statement that

> If economic and social efficiency is the objective, then it appears that the most able must be identified early and educated to the hilt of their potential, quite irrespective of their social origins. If the efficient operation of the social system requires the maintenance of inequalities of wealth, status and power, these privileges should be rewards for qualities and skills which are relevant to social efficiency ... Hence, equality of opportunity, requiring removal of hindrances to the development of individual talent, has to be engineered through the educational system. (17)

The failure of educational equality

The attempts to eradicate educational equality met with limited and ambiguous success, a consequence that prompted various responses. The first was to argue, as Coleman did, that schools are too weak an agency to put right the ills of society - "complete equality of opportunity can be reached only if all the divergent out-of-school influences vanish." (18) Schools cannot, then, compensate for society. Secondly, there was the view that educational equality was "not a meaningful term", but that "a proper formulation would use the term "reduction in inequality ... rather than equality". (19) In short, it began to be understood more clearly that inequality was multi-causal, and had been understood too narrowly.

26

This produced also a shift from a deficit model of the pupil to a pathology model of the school; the school, as an agent of the political establishment, was more likely to consolidate inequality and to attempt to legitimise it than the reverse :

> By giving individuals aspirations strictly tailored
> to their position in the social hierarchy, and by
> operating a selection procedure which, although
> apparently formally equitable, endorses real
> inequalities, schools help both to perpetuate and
> legitimise inequalities. By awarding allegedly
> impartial qualifications ... for socially conditioned
> attitudes which it treats as unequal "gifts", it
> transforms de facto inequalities into de jure ones
> and economic and social differences into distinctions
> of quality, and legitimates the transmission of the
> cultural heritage. (20)

In other words, it is pointless - so the argument goes - to tinker with educational systems or processes while leaving unchanged the society within which education operates.   A belief that "better" schooling means a "better" society might result in participation in streamlining an educational system so that it more efficiently continues to "perpetuate and legitimise inequalities".

The De Lange Report and Education Equality

The De Lange Report basically accepts the definition of educational equality presented by Entwistle. Looking at the current educational dispensation in South Africa, it states that

> Some of the grounds on which 'differentiation' occurs
> for example ability, interest, aptitude and
> occupational orientation, are probably relevant and
> consequently meet the demand for justice insofar as
> they have a bearing on the nature and meaning of
> education and its requirements as a social practice.
> (5.3.2, p 209)

On the other hand, the Report continues,

> ... differentiation also rests purely on the basis of
> race or colour, which cannot be regarded as relevant
> for inequality of treatment. Examples of this are the
> treatment of different racial groups in a way that is
> strikingly unequal, for example in the distribution of
> education in terms of per capita expenditure,

proportion of qualified teachers, quality and quantity
of facilities such as buildings, equipment and sports
facilities. A further example is where admission to
educational institutions is regulated mainly on a
racial basis... Differentiation based purely on
difference of race and colour ... is ... contrary to
the social and ethical demands for justice.
(5.3.3, p 209)

The conclusion to which the Report comes, in 5.3.4, is that :

the distribution of education will have to be organized
in such a way that everyone will receive a rightful
share, regardless of race, colour, socioeconomic
context, ethnic context, religion, sex or geographical
location. (p 209)

The Report recognizes also that unilaterally determined
racial classification and the enforced segregation of
schooling on the basis of that classification must result in
educational inequality, for in speaking of Third level
Management structures it states that :

In the setting up of school districts the wishes of
parents, teachers and committee should be considered
and the greatest possible weight given to the principle
and practice of 'free association' rather than to
predetermined 'cultural identities' established from
above. (p 201)

It also concedes the need for "The granting of the right to
Councils of autonomous educational institutions in higher
education to decide who should be admitted as students",
(p 216) and yet retreats from the logic of its own arguments
by not stating that racially segregated schooling is
inherently unequal, for it states support for "the following
approach as a point of departure : the reduction and
elimination of demonstrable inequality in the provision of
education available to members of the different population
groups" (p 211, emphasis added). We seem to be back to the
point of separate but equal education.

In fact, the Report seems far more concerned to make
proposals aimed at producing the necessary manpower than at
achieving educational equality. Speaking of the relationship
between education and manpower, the Report warns of the
dangers of :

an incorrect understanding of the relationship between
education and economics and an over-evaluation of the

meaning of education for the masses. <u>Investment in</u>
<u>education can only show dividends if it can guarantee</u>
<u>that the manpower potential of a country is applied</u>
<u>productively in its development. If it cannot do so,</u>
<u>then at worst investment in education can stand in</u>
<u>opposition to instead of in support of economic</u>
<u>development.</u> (p 20, emphasis added)

The Report also treats us to vague generalities such as the
"inadequate harmonization" between education and the
economy, and "the social needs of a country". It also
argues that "the aim of development" is "provision of
skilled manpower with the value system, insight and skills
necessary to contribute to the develolment of the country".
(p 32) A similarly narrow view emerges in the great desire
to promote "career orientated" education at the expense of
what is vaguely dismissed as "the 'academic' value system"
operating in education.

A frequently voiced interpretation of the history of South
African education is that the schooling provided for those
classified other than white is a process overwhelmingly
aimed at producing workers with the appropriate job skills
and attitudes. That is a schooling system designed to
socialize them into acceptance of their lot - unless, of
course, "gaps" exist which cannot be filled by whites. The
Report betrays this preoccupation in the statement that
"Since the contribution that whites can make would seem
already to have been utilized to a large extent, that of the
non-white groups will necessarily have to increase rapidly".
(p 23)

The Report makes it quite clear that "Systems of education
are a part of the social, economic and political structure
of a country. Acceptance by, and the involvement of, the
"user" are essential." (p 27) Yet it fails to recognize
that any attempt to improve "non-white" education for
manpower reasons, or to step up significantly the role of
"career-orientated" education within a racially segregated
school system in which the "white" school sector remains
largely "academic", is certain to be rejected by
<u>anderskleuriges</u> as merely another ploy to "educate" them
only in so far as their labour is required. The issue
ultimately is not a matter of equality at all, but a matter
of legitimacy - of the <u>bona fides</u> of the State. This is,
in fact, chillingly recognized in the last paragraph of
Chapter 3 of the Report:

Finally there appear to be serious problems with
regard to the acceptability of educational practice

in the RSA. This acceptability is related to two
factors : in the first place, the acceptance by the
'users' of the authority responsible for the
establishment of the education system; and in the
second place the involvement of the 'users' in
decision-making processes . (p 90)

A population that is confident that its government firmly
intends to do the best it can for all the people will
tolerate inequality in education and will appreciate the
financial and other constraints that exist. Schools have
not been burnt down solely becuase they are inferior, but
because they are considered to be physical - one cannot
always say "concrete" - manifestations of a government's
illegitimate intentions. So people will endure educational
inequality if they are convinced of a government's good
intentions; on the other hand, this is why education has to
be understood as essentially political, and why educational
reforms by themselves will not be sufficient. Equal
education is a fiction in an unequal society : schooling -
any brand of schooling - will always be unacceptable to the
majority if it occurs within an economic, social and
political framework that is unacceptable to the majority.

The equality debate - implications for South Africa

1   We must warn again against the temptation to borrow
    indiscriminately from comparative data. Because an "input"
    model of equality is not a sufficient model in the USA does
    not mean that equality of facilities is not to be aimed at
    in South Africa - it is simply to say that equality of
    input is not enough.

2   Where educational institutions have to a significant extent
    become flashpoints within a society in conflict, education
    must not be left with a crisis of confidence or a crisis of
    expectation that education itself cannot meet. Dalin, in
    his book Limits to Educational Change, makes precisely this
    point :

        It is mainly in promising equal opportunity that
        education has failed to come up to expectation. The
        result has been disappointment and frustration for
        those within the educational system as well as for
        those outside the system who had high hopes of what
        might be achieved. Caught in this dilemma were
        educators who never promised the sure delivery, but
        were left accountable at the end. (21)

    To accuse an educational inquiry of "going beyond its brief"

by pointing out to government that education cannot compensate for society is to misunderstand the essentially political nature of educational provision.

3   Programmes for educational equality in South Africa must not be based on the "white model", ie trying to replicate for all persons what has been made available in the most advantaged educational sectors. South Africa cannot afford this; nor should the financial implications of extrapolating the white model be allowed to be used as excuses for policies of gradualism. Too much has been spent on "white" education with too little effect; a less costly and more effective approach is essential. Also, "models", suggest grand designs : flexibility is going to be crucial.

4   Any programme for equalising educational provision has, however, to face the problem of the utilisation of existing high-cost facilities, which fall almost exclusively in white group areas. Decisions that all future buildings, for instance, will have to be less costly might be seen as an attempt to perpetuate inequality should current high-cost institutions remain segregated for whites. If desegregated an inevitable consequence will be the emotive issue of "busing", the onus on travel falling on the disadvantaged. What is more, a plan that provides moderate cost buildings for all communities, leaving it to them to provide additional buildings, equipment and staff makes it easy for advantaged communities to perpetuate their privilege irrespective of the commitment of disadvantaged communities to education.

5   Desires for educational equality tend to be based on the assumption that schooling is a "good" and that therefore more schooling would be better. Schooling and education tend to be equated without alternative approaches to education being explored adequately. Tied to this is the question of legitimacy, in that the majority of the population might well be very suspicious of attempts to provide education in a variety of ways of which the school would only be one.

6   Crucial also in the reduction of educational inequality will be the formulation of curricula that are not guilty of ideological domination by one group. How, for instance, does one equalise education when the bulk of the population study three languages, and study their own subjects through the medium of a language other than their mother tongue? Would a system of schools segregated on the basis of language not also be merely the extension of segregation by other means? As far as subjects other than languages are concerned, any

31

move towards equality would have to allow for truly
representative curriculum development, perhaps best
achieved via the core-plus-options approach. It is here
that a balance between centralisation and decentralisation
in education would be of considerable value.

7   The question of "standards" in the construction of equal
education is also one subject to the risks of ideological
domination by one group and one raising the danger of a
perpetuation of inequality by means of policies of
gradualism based upon white-determined "standards". Given
the need for more flexible educational provision, the issue
of more flexible accreditation procedures becomes crucial.
To cite one example, if the equalisation of education
involves having available sufficient adequately trained and/
or qualified teachers, this requires a massive programme of
teacher upgrading. Do practising teachers then have to
undergo precisely the same programmes as beginning teachers,
for instance in the case of bilingualism requirements? Much
of what is defended as "maintaining standards" in the
advantaged sectors of education is already merely a
trivialisation of knowledge, a manipulation of results and
the promotion of ritual learning in schools - in fact,
nothing but the bastardisation of standards in the name of
standards.

8   Another assumption that needs to be laid finally to rest is
the idea that education can be separate but equal, especially
as this seems to be the intention in the Prime Minister's
brief to the HSRC that it devise a "programme for making
available education of the same quality for all population
groups". The famous US Supreme Court decision of 1954
stated in fact that involuntary segregation in public
education was inherently unequal. Two crucial factors
emerge : first, that if people are allowed - in a new
educational dispensation - to operate "closed" schools,
whether for "ethnic" or religious or other reasons, then
there should also be sufficient "open" schools to allow for
a genuine choice. Secondly, the racial classification of
people and their resultant allocation to certain schools
will have to be recognised as involuntary and as therefore
essentially discriminatory.

9   Any programme devised to reduce educational inequality is of
necessity going to have to develop adult and non-formal
educational facilities and opportunities to a significantly
greater extent than in the past, where the government's
attitude to non-formal education has been one of deep
suspicion. Obviously, strategies for equalising education
cannot be confined to persons of "school-going age": massive

programmes of adult education are required. Yet as Professor
Clive Millar of UCT stated in his inaugural lecture: "Few
countries have developed an ecology less conducive than ours
to the development of opportunities for adult education".
(22)

10   Another danger in determining educational policies aimed at
     reducing educational inequality is that a new educational
     dispensation may be tied very closely to manpower
     requirements. Attempts to create technical schooling to a
     far greater extent than at present may turn out to be a
     strategy for discrimination by other means: the degree to
     which it avoids this risk will depend upon the selection
     procedures for entrance to such schools and the assumptions
     upon which these procedures are based. Also, the whole
     debate concerning the correlation between schooling and
     manpower rests upon a paradigm of "development" that cannot
     merely be taken for granted.

11   Inequality is multi-causal; education is essentially
     political. Therefore "A purely educational response to the
     initial problem is unlikely to be successful. Educational
     under-achievement is seen to be merely one manifestation of
     a number of social and economic disparities experienced by
     disadvantaged groups". (23) The resolution of problems of
     educational inequality requires policies extending far
     beyond education; acceptance of an educational dispensation
     is also dependent upon its being seen to operate within a
     social, economic and political context that is acceptable.
     You cannot "normalize" education in an abnormal society and
     expect the "clients" to be satisfied.

TECHNICISM AND DE LANGE: RELECTIONS ON THE PROCESS OF THE HSRC INVESTIGATION

Peter Buckland

While acknowledging the necessity for a critical analysis of
the more explicit ideological assumptions underlying the
Report of the HSRC Investigation into Education - reflected
in the relationship between schooling and the workplace, the
anxieties about schooling and the social order, the factory
model of the school or the essentially reformist approach -
this article argues that another less visible set of
assumptions underlies the whole Investigation into Education.
They are reflected in the technological mode of rationality
which is the basis of the Report and which appears to have
escaped critical comment because, as a way of thinking, as a
mode of knowing, it has attained virtual hegemonic status
among South African educationists and academics. In seeking
to understand the ideological functioning of the technicist
assumptions so deeply embedded in the De Lange Report, this
article examines the process of the whole Investigation in
its socio-historical context in an effort to understand how
they have served the interests of maintaining the status quo,
and why they have so successfully evaded critical comment.
This is approached by shifting the focus of critique away
from the Report as product, and examining the whole process
(1) of the Investigation, including context, the methodology
of the Investigation and the responses to it.

TECHNICISM

Manfred Stanley defines technicism thus :

> Essentially technicism is a state of mind that rests
> on an act of conceptual misuse, reflected in myriad
> linguistic ways, of scientific and technological
> modes of reasoning. This misuse results in the
> illegitimate extension of scientific and technological
> reasoning to the point of imperial dominance over
> all other interpretations of human existence. (2)

The important point is not that the technological mode of
rationality is 'wrong' in itself, but simply that its
application to social and educational issues to the exclusion
of all other modes of knowing means that it tends to act as
a set of lenses which focus only on certain issues and avoid
others. Henry Giroux makes the point that all modes of

rationality contain a "Problematic" which he defines as 'a "definite theoretical structure" characterized by a dialectical interplay of structuring concepts that serve to raise some questions while suppressing others.' (3)   This process operates as an ideology when it serves the interests of a power group.

It remains to establish what are the key features of the technological rationality, how they are reflected in the HSRC Investigation into Education, and how they serve the power interests in the South African socio-historical process.

A key assumption of the technicist mode of rationality is that the deductive - nomological model of explanation, the model most closely associated with the natural sciences, with its interest in explanation, prediction and technical control is seen as vastly superior to the hermeneutic principles underlying "speculative" social theory.   The positivism implicit in this involves the assumption that social science theory can and ought to be objective, that the relationship between theory and practice in the domain of science is primarily a technical one in that social science theory can be used to predict how a course of action can best be realized, and, finally, that the procedures of verification and falsification must rely upon scientific techniques and "hard data", the results of which are seen as value-free and intersubjectively applicable. (4)

A corollary of these assumptions is the dichotomy between "facts" and values, and a tendency towards what CA Bowers (5) refers to as "context-free thinking" as well as an ahistorical approach to social issues which views them in terms of "problems" to be "solved" by technical means.   When applied to education these assumptions lead to the emergence of an instrumentalist tradition in which progress is seen in terms of technological "growth" and learning is reduced to the mastery of skills and the solving of practical problems.

Technicism in education frequently assumes the form of systems thinking, perhaps the most extreme example of technological consciousness.   The assumptions underlying the systems approach to education management include, as Michael Apple (6) points out, the advocacy of consensus and the negation of intellectual and valuative conflict and a limited perspective of scientific method which is more reminiscent of nineteenth century positivism than of current scientific and philosophical discourse.   This tends to lead to a shift in focus from moral and ethical questions towards a focus on questions of efficiency and control.

Implicit in the systems approach, too, is a tendency to name
and classify segments or components of reality, and an
artificial dichotomy between theory and experience, with a
hierarchy of knowledge which views abstract thought as
inherently superior to experience and thereby defines and
elevates the status of the "expert".

The essence of all this is that technological rationality is
basically a categorical mode of reasoning which ignores the
fundamentally dialectical nature of the social world.
CA Bowers comments :

> The categorical mode of thought which characterizes
> technicism in education is expressed in the view
> that theory is inherently superior to commonsense
> experience, that the future can be anticipated in
> terms of technological innovation, that the
> perfection of human nature is essentially a problem
> in engineering more adequate social environments,
> that quality rather than equity is the basic moral
> problem and that it can be solved through a
> legalistic (expert knowledge) approach, and that
> communities are simply social systems or collectives
> that can be redesigned by well intentioned theorists.
> As a categorical mode of thought, it ignores the
> complexity of experience. (7)

SOCIO-HISTORICAL CONTEXT

To attempt to explore the implications of the De Lange
Report without locating it in its context within the South
African socio-historical process would be a profoundly
technicist act. That most of the discussion around the
De Lange Report so far has tended to abstract the document
from its social and historical context is indicative of the
extent of the technicist hegemony in South African education.
As I have discussed at length the historical location of the
Report elsewhere (8), I will confine myself here to
reiterating the major themes of that analysis.

First, the elements of continuity of the 1981 HSRC
Investigation into Education with a long line of previous
commissions of inquiry are reflected in the fact that
virtually all the major recommendations of the De Lange
Report simply reiterate similar recommendations in previous
reports: calls for industrial training, vocational education,
compulsory school attendance, increased worker efficiency,
stress on language skills, and for recognition of "cultural
difference", - even the "single Ministry model" and
increased financial support - all of these have been posited

in previous "investigations", and none has yet been effectively implemented.

Second, important as it is to recognise the elements of historical continuity in the HSRC Report, it is also essential to be aware of the discontinuities, the features which make this investigation different from those which preceded it. First, the scope of the De Lange investigation, and the scale on which it was launched make it stand out as the most comprehensive investigation in South African educational history, covering all levels of education, formal and non-formal, for all inhabitants of the country. A second discontinuity of this investigation is the rhetoric of "science" used, which has been used to differentiate it from previous commissions. A third feature is the commitment in the terms of reference to "education of equal quality for all population groups", although it appears that this is to be interpreted in its most limited sense by the authorities.

A third theme to emerge from the analysis of the socio-historical context was that the whole investigation appeared to be dominated, like many of its precursors, by two underlying anxieties arising out of an alleged "skilled manpower shortage" and "social unrest", in this case indicated by the 1980 school boycotts and the industrial action of workers in the Eastern Cape. The historical context of each of these elements was traced to its location in the dynamics of the economic and political structures of the society, and it was argued that while the relationsnip between schooling and tne "manpower crisis" was more complex than conventional wisdom held, the anxiety about social disorder and social control was clearly a powerful force underlying the whole Investigation. The schooling system was not producing workers with "realistic aspirations" and "appropriate value systems" required by industry, and the results of this "inadequate harmonization" put society "at great risk" and was "a road to disaster". (9)

This study of technicism in the De Lange Report also requires an examination of the ideological shifts of the ruling elite in this country to accommodate changes in the social structure, such that the rationality of the technocrat gained acceptance in a political context formerly dominated by nationalist ideologies whose original stance was one of resistance to modernization. The National Party, when it finally came to power in 1948, represented basically the alliance between white workers and domestic agricultural, manufacturing and finance capital. The nineteen sixties saw the emergence of the 'politics of security' as the emphasis

of the ideology shifted from Afrikaner nationalism to white nationalism. But the really significant shifts in Nationalist ideology have their origins in developments in the social structure other than merely white parliamentary politics. The decade of the 1970s with its international economic turmoil and insecurity combined with the emergence of more concentrated corporate production, contributed to a rise to prominence of international capital, as well as to a heightened anxiety over labour relations and social security precipitated by the unrest in schools in 1976 and 1980, and the industrial unrest signalled by the Natal strikes of 1973 and in the Eastern Cape in 1980. Anxiety over labour relations and social security led to the recognition of two new power factors in the white state - the businessmen and the military. The policy of Total Strategy represents a move toward a tentative alliance with these new forces.

A more instrumental approach to the policy of separate development began to emerge during the period 1974 - 1977, described by Giliomee as the "watershed period (when) they began to see separate development as an instrument rather than a goal". (10) Kurt Danziger sees this in terms of

..... a clear shift from a justification of existing institutions in terms of intrinsic value to their justification in terms of their instrumental utility or effectiveness. Secondly, we observe a shift from cultural to political and finally to economic institutions as the main focus for legitimating ideas. (11)

It became more clear with the coming to power of PW Botha and his introduction of the policy of "rationalization" of the bureaucracy that a fundamental tension in the ruling party existed between modernization and nationalism. Economic, political and social pressures had resulted in a shift away from orthodox Christian Nationalism and Afrikaner Nationalism toward a more instrumental approach to social policy. The new breed of Afrikaner which emerged to challenge the ideology of the Verwoerdian era had been through the modern schooling system, which, despite its apparent ideological affiliations to Christian National Education, was rapidly reflecting the technocratic ideals of a modernizing society. The transformation of schooling from its origins in Christian National Education, one of the fundamental pillars of the conservative Nationalist ideology, into a powerful force for modernization was achieved through the infusion into the education bureaucracy and education policy of a technicist ideology which tended to elevate goals of efficiency, management and

control to primacy over the previous explicit goal of
preservation of Afrikaner identity. Such a transformation
required the institution of powerful centralized control
over departments, and powerful departmental control over
teachers.

The past two decades have seen a battery of legislation to
establish such control, an early and crucial example of
which was the National Education Policy Act of 1967, which
despite its commitment to education of a "Christian" and
"broad national character", served primarily to centralize
control of the provincial schooling system in order to
implement a modern differentiated curriculum calculated to
meet the "needs" of a modernizing economy. In the event,
the provisions for differentiated curricula were not
implemented for several years and the HSRC was commissioned
to investigate the matter.

The Report of this investigation, published in 1972 (12)
attempted to outline the details of a technically reasoned,
functionally oriented, differentiated education programme
backed by a powerful guidance service to channel white
youths into schooling appropriate to the maintenance of
white economic and political dominance. Control of teachers
was increased through the institution of "scientific
management" procedures, implemented in part through the
South African Teachers Council for Whites Act of 1976 and
the introduction of "accountability" programmes such as the
"merit award system".

The "twin crises" in education in 1980 suggested that
"differentiated" education, which was slowly being
implemented in various forms in all education departments,
was not operating efficiently enough. Total strategy, and
the accompanying rhetoric of reform, demanded a wide ranging
revision of the entire education system in a way that would
involve "private enterprise" more actively in the process of
schooling. The technicist values of efficiency and control
implicit in "scientific" research, "scientific management"
and "differentiated education" provided the legitimating
ideology expressed in terms of "equality", modernization,
"harmonizing" of educational "needs" with "the needs of
society", and "optimal returns on investment in education".
Wrapped in the rhetoric of "science" and "reform" this
proved a powerful medium for the control required to
implement this modernization which is likely to encounter
some resistance both within the National Party and in the
broader society. Considering the depth of hiddeness at
which the process operates in American curriculum design,
Michael Apple comments :

> .... the real issue is not that systems techniques
> yield information and feedback that may be used by
> systems for social control. They themselves are
> systems of control. What is of equal importance is
> that the belief system underlying them and a major
> portion of the curriculum field stems from and
> functions as a technocratic ideology which can often
> seem to legitimate the existing distribution of
> power and privilege in our society. (13)

The point of this brief overview of the socio-historical
context is to indicate the shifts in the social and economic
order which have facilitated the evolution of a ruling class
ideology which incorporates fundamental technicist
assumptions, and the way in which these assumptions are
embedded in the very context which gave rise to the De Lange
Investigation. The danger of these assumptions is their
very embeddedness in the modernizing ethos which pervades
the "developing" country. The technological mode of
rationality does not provide the vocabulary or conceptual
tools for a critique which could expose the way in which such
assumptions serve the power interests of the ruling elite.

TECHNICISM AND HSRC INVESTIGATION

One of the widely acclaimed features of the entire
investigation was the assertion that this project, under the
auspices of the HSRC, was to be a "scientific and co-
ordinated investigation" rather than the "opinion" of a
commission, as had been the case previously. The entire
project was planned in accordance with the HSRC masterplan
for educational research, the South African Plan for
Research in the Human Sciences, which is explicitly
calculated to achieve the "balanced development" of the
human sciences in the RSA, to isolate "national problem
areas" and to "stimulate, co-ordinate, finance and control"
research into such areas. (14) The document outlining the
SAPRHS serves as a classic illustration of the way in which
technicist assumptions work in the interests of order and
control :

> Taken as a whole the proposals that follow represent
> an attempt to seek consensus regarding the working
> method that will be adopted in the implementation of
> the SAPRHS - a working method that will be
> sufficiently flexible to accommodate the wide range
> of subjects, approaches, problem areas, ideological
> orientations, etc., that exist in the human
> sciences. (15)

41

The call for consensus and the search for a neutral
methodology is followed by an outline of the approach to be
used. The national problem areas are selected by a committee
of experts, and placed in order of priority on the basis of
a "scientific survey". A Main Committee for each "problem
area" is appointed, and their first task is to divide the
topic into a number of smaller areas, for each of which a
Working Committee is constituted to "conduct research". A
report from each Working Committee is then submitted to the
Main Committee which then synthesises the various reports to
produce a final document. In the case of the De Lange
Committee, this involved the "synthesising" of some 20 000
pages of "research" into a two hundred page final report.
Heavy stress was placed by the Main Committee on consensus,
such that any vestiges of scientific inquiry method were
sacrificed and the final report represents an account of the
issues that the members of the committee were able to agree
on, or were able to couch in such ambiguous language that
their conflict was submerged beneath a layer of benign
circumlocution. On the basis of this it seems extraordinary
that the final report should still be regarded as evidence
of scientific inquiry, yet the rhetoric of science is
constantly used to attach a value-free image to the
Investigation. The Report of the Main Committee is, on its
own admission,

.... not merely an account of the findings and
recommendations of the different work committees,
but rather an interpretation of these findings and
recommendations viewed as a whole. An attempt was
therefore made to synthetize the wealth of information.
(16)

The tendency to deny or eliminate conflict, or to redefine it
and search for consensus is frequently defended by the
argument that this constitutes an attempt to be scientific
about problems. Herein, argues Michael Apple, lies the basic
difficulty since this perspective of science is notably
inaccurate:

To link scientific rationality with consensus,
however, is to do a disservice to science and shows
a profound misunderstanding of the history of
scientific disciplines .... the very normative
structure of scientific communities tends towards
skepticism and not necessarily toward intellectual
consensus. The call for consensus, thus, is not
a call for science. (17)

Apple goes on to argue that while the advocates of systems

42

procedures seek to enhance the scientific status of their work, the systems thought they have borrowed is not from the scientific branch of systems logic:

> Rather, they have chosen to appropriate the models
> of operation of the business community ... One has
> to wonder if their models are indeed appropriate for
> dealing with students. The issue is made more potent
> when one realizes that systems management was created
> originally to enhance the ability of owners to control
> labour more effectively, thereby increasing profits
> and weakening the burgeoning union movements early
> in this century. (18)

The language of science attached to the De Lange Investigation, then, serves a rhetorical function. But it is a powerful rhetoric in a rapidly modernizing technological society which widely regards "science" as "value-free" and apolitical. Although the illusion of strict scientific method cannot really be maintained with regard to the Report of the Main Committee, some of the implicit assumptions of the positivist approach to the social world nonetheless survive in the structuring of the Report. Key among these is the assumption that the problems of education are essentially technical ones that can be solved by technical solutions. The basic pattern of the Report reflects the sort of "examination, diagnosis, prognosis and prescription" approach which Karabel and Halsey describe:

> Theoretically informed exchanges between social
> scientists and the government may well reveal that
> there are "social problems" that cannot be formulated
> adequately in terms approximating those of medical
> problems in which the social scientist is defined,
> by analogy, as a skilled diagnostician. Such a
> model, apart from assuming that there is a social
> science theory to be applied in the same way that
> doctors apply medical theory, also takes it for
> granted that there is agreement about social ends
> just as there is consensus about the nature and
> desirability of good health. (19)

On looking at which interests are served by such an approach, they go on:

> It is in the interests of established government to
> define the social sciences as apolitical and
> organized social sciences as, in effect, an extension
> of the civil service. On such a view problems are

essentially technical and the role of the social
scientist is that of a hand-maiden. Research
strategies and priorities, from this perspective,
are finally left in the hands of the government.
(20)

A consequence of this is that the investigation is dominated
by essentially reformist ideologies which tend to focus on
such questions as "How can we make it work better?" rather
than on more fundamental questions such as "How does it
work?" and "Who benefits?" A certain amount of excitement
was generated by the statement in the Report which
acknowledges the essentially political nature of schooling,
but it soon emerges that questions of efficiency and
control are regarded as crucial, and the political element
of schooling is reduced to a question of "user
participation":

Various criteria can be applied to evaluate
education management and a variety of factors
exercise a determinative influence on these
criteria (for example the development level of
the country and its people, homogeneity in respect
of the composition of the population and political
philosophy). However, in the final instance,
structures for education management should be based
on educational considerations ....
Systems of education are part of the social,
economic and political structure of a country.
Acceptance by, and involvement of, the "user" are
essential. (21)

Giroux, however, points out that

.... acknowledging the social and cultural basis
of the character of different modes of pedagogy is
important but incomplete. This approach must be
supplemented by analysing the assumptions embedded
in a given educational paradigm against larger social
and political interests. Questions which arise out
of this type of analysis might take the following
form: What interests do these assumptions serve?
What are their latent consequences? What are the
material and intellectual forces that sustain these
assumptions and their corresponding paradigm? (22)

It is just such questions which the HSRC Main Committee
Report does not ask. The technicist assumptions implicit
in the methodology serve to rule out the asking of such
questions which may present a fundamental challenge to the

status quo. What is not reflected in the methodology of the Report is the dialectical interplay between knowledge, power and ideology. Giroux argues that this results in a confusion of objectivity with objectivism. The former he describes as a scrupulous attempt to minimize biases and false beliefs. The latter, "objectivism",

> .... refers to an orientation that is atemporal and ahistorical in nature. In this orientation "fact" becomes the foundation for all forms of knowledge, and values and intentionality lose their political potency by being abstracted from the notion of meaning. (23)

Despite the "principles for the Provision of Education" which were supposed to guide the investigation and which acknowledged in the vaguest possible terms the importance of such values as "equality", "recognition of commonality and diversity" and "freedom of choice", the subtle framework of the methodological assumptions, the ahistorical approach and the call for consensus served to guide the Main Committee away from considering the fundamental implications of these values towards consideration of technical issues.

This process is reflected in the recommendations of Main Committee which, in pursuit of consensus in such ideologically sensitive areas as language medium and curriculum, resorts to a concern with "means" rather than "ends". After 13 months of "research", Recommendation 30 reads :

> The principle of the use of mother tongue speakers in language instruction also merits attention. The provision of support material on cassette from a central resource centre is recommended. (24)

The first sentence represents a classic example of what Michael Young has called "the politics of non-decision making". (25) An even more crucial process is evident in the second sentence, which recommends the use of technology. The point is that while the committee was unable to reach agreement on ends, it was quite prepared to make recommendations regarding the means - technology. The use of such technology is apparently regarded as non-problematic, and this assumption underlies a great many of the recommendations of the Report.

Perhaps the most powerful evidence of a technicist mentality is contained in the following statement from the Report :

South Africa is a developing country that is changing
more rapidly than most developed countries. Modern
science, technology and management skills, which are
the most powerful resources that man has ever had at
his disposal to enable him to change his environment,
are not yet the cultural assets of significant sectors
of our population. (26)

Progress is seen in terms of technological growth,
modernization and "development", which itself is defined,
somewhat tautologically in terms of economic development.

.... the aim of development, namely provision of
skilled manpower with the value system, insight and
skills necessary to contribute to the development of
a country. (27)

Moreover, "modern science, technology and management skills"
are together seen as "the most powerful resources that man
has ever had at his disposal to enable him to change his
environment" and are seen as "cultural assets" which it is
assumed must be acquired by "significant sectors of our
population". The modernizing society is taken uncritically
as the status quo to which man must adapt, just as the modern
school is regarded as a given for which a child must be
made "ready":

Pre-primary education offers the child a wonderful
opportunity to move over easily (from an affective -
social point of view) to the formal education of the
primary school; in doing this it achieves more than
school readiness and provides a wider readiness for
life. (28)

Systems management and a systems approach to educational
problems emerge as the basic "neutral" ground on which all
members of the Main Committee were able to reach consensus :

Educational technology enhances and enriches the
quality of education in the classroom. It brings
the outside world of education into the classroom
thus enriching learning activities. The use of the
systems approach which aims at establishing specific
goals and using the most appropriate media, enables
accurate evaluation to be carried out. The accent
therefore shifts from the teacher as the only source
of information, to the teacher as manager in the
teaching-learning situation. (29)

The primacy of the technicist mind-set is reflected strongly

46

in the language used; an extended technological metaphor is
used to describe the new "educational structure":

>   Canalization mechanisms are means by which the 'inlet',
>   'flow' and 'outlet' of learners are regulated in the
>   educational structure.
>
>   These mechanisms can be built into, as well as added
>   to the educational structure. However, the essence
>   of the matter is that the mechanisms function between
>   two points, namely inlet and outlet, and can be used
>   in various ways to the advantage of the individual
>   and the manpower needs of the country. (30)

Another important technicist feature is the subtle way in
which a hierarchy of knowledge is implied in the
recommendations. First, the committee itself is composed
largely of "experts". When all else fails, recommendations
are passed for the use of more experts:

>   .... it is recommended that a committee or committees
>   of expert teachers and/or educational planners
>   representative of all educational services together
>   with other interested parties be appointed to work
>   out the aims and objectives for English and Afrikaans.
>   (31)

Despite a passage regretting the fact that "the abstract
world of ideas" is valued over the practical world (and this
is offered as a reason why there is often a tendency to look
down on manual work and practical skills), the proposed
education structure by which pupils are systematically
"canalized" into industrial training implies a none too
subtle hierarchy of knowledge in that only those pupils who
remain in Grade O and Grade I "grades of difficulty" are
retained in the schools.

The treatment of social issues as technical problems open to
technical solutions, the componential thinking implicit in
the division of "education" into eighteen separate "areas",
the ahistorical approach and the orientation to the future
all serve to rule out consideration of how schooling has
been used to further political and economic ends. Knowledge
is seen in terms of skills, with an "appropriate value
system" serving to legitimate the differentiated acquisition
of such skills.

The technicist features of the Report reflect an ideology
that is deeply embedded in western cultural patterns, such
that many of the "structuralist" criticisms of the Western

model of schooling also rest on technicist assumptions, particularly those which ignore the dialectical nature of the social process and talk in terms of domination/submission, of "doer" and "done to". Likewise, much of the praise and criticism for the Report itself rests on a futile attempt to evaluate the document "on its own merits", abstracting it from its socio-historical context.

The technicism in the Report operates as an ideology because it serves to buttress the status quo by undermining the dialectic of human potential and will thereby denying the possibility that human beings can construct their own reality and can alter that reality in the face of domination. For this reason technological rationality has been incorporated into the ideology of those elements of the ruling elite which, in the face of the realities of the "politics of survival", have chosen to seek to modernize and streamline apartheid. This is not meant to suggest a conscious conspiracy to adopt technicism as a new instrument of oppression; rather is is argued that the technicist features of the Western mind-set which underlie the technological revolution and the ethos of modernization so serve the power interests of significant sectors of the dominant groups that they are accepted uncritically as "rational" or logical.

What is perhaps more difficult to understand is the way in which technicism remains unseen or is accepted uncritically by those whose interests are apparently not served by it. Crucial to an appreciation of this is an understanding of the way technological rationality has become the prevailing hegemony. The language of modernization and the logic of technology constitute a powerful psychological and material force. The daily routine of our lives is already structured to some extent by the demands of the technological revolution. But above all the language of technology and the categorical mode of thinking inherent in it serve to deny the vocabulary and the conceptual tools, such as historical consciousness, with which to critique the prevailing belief systems.

There is, inherent in this argument the danger of an over-deterministic view of hegemony, such that we are left with a feeling of helplessness and despair in the face of the extraordinarily powerful forces of technology and modernization. Such despair itself reflects a categorical mode of thinking which ignores the dialectical nature of the social process. Wherever there is an hegemony, there is the possibility of a counterhegemony. Hegemony as a mode of control is not simply a question of projecting the ideas of a dominant elite into the minds of the oppressed. Moreover, it has to be constantly reinforced and adapted to

48

accommodate changing historical circumstances and new forms of resistance.

The technicism which the De Lange Report reflects can and must be countered. But it cannot be critiqued with the language and conceptual tools of the technological mode of reasoning. What is urgently needed is an abandonment of the categorical mode of thinking that cannot tolerate ambiguity and avoids or conceals conflicts in the search for consensus. A vital element of this process is the raising of awareness of the role of language and metaphor in the process of social control, and the provision of the necessary vocabulary with which to critique the manifestations of the technicist mind set. Equally important is the need to develop historical consciousness and to re-learn our history. This may enable the de-reification of the structures which have come to wield such influence over our lives. Only when their human authorship is acknowledged can their vulnerability to change be recognised. We must reaffirm the potency of experience in relation to theoretical or abstract knowledge so that the status of the "expert" can be seen in perspective.

Above all we must seek to raise the status of ethical and moral debate so that it holds at least equal status with technical and efficiency "talk". Until we as educators tackle these challenges, documents such as the De Lange Report, despite the rhetoric of "reform" and "change", will continue to constitute powerful instruments for the maintenance of the status quo.

Notes

(1)   I am aware that the dichotomy between process and product is a false one which itself reflects the categorical mode of reasoning against which I am arguing. The device is used here merely to deflect the reader away from a consideration of the Report in isolation, towards a more realistic view of it as part of an historical process.

HOW A COMMUNITY RESPONDS

DE LANGE AND THE AFRIKANER VOLKSKONGRES, 18.3.82. - 2O.3.82.

Joe Muller

"In hierdie ernstige tyd waarin... die Afrikaner in die
besonder hom bevind, 'n tyd waarin die onderwys, die kerk en
die tradisies van die Afrikaner die teiken van die vyand
geword het, is dit van rigtinggewende belang dat die
geskiedenis... sonder pretensie as die rigsnoer aan die
opkomende geslag voorgehou word". (1)

1   Huismoles en broedertwis; divisions and traditions in
     Afrikanerdom.

The NP has, since 1948, represented an alliance between
Afrikaner petty bourgeosie, workers and domestic agriculture,
as well as manufacturing and finance capital (2). This
alliance is precarious because the economic and political
interests of these groups are potentially in conflict. One
can also see superimposed on this alliance a cultural domain
composed of the influential Afrikaner churches, politico-
cultural organisations and, increasingly, the military,
having a largely coherent understanding of 'volk', 'vyand'
and the national interest. A picture then emerges of a
ruling block economically divided but culturally unified.

This situation gives rise to two factions: a 'conservative'
faction (farming, worker and petty bourgeosie) and a
'reformist' faction (finance capital and manufacturing).
Economic developments have recently accentuated the
incompatibility of the interests of these two factions, with
the 'reformist' faction prevailing at present. The resulting
re-alignments are being bitterly negotiated in the cultural
domain, and the unity of the ruling block is now in serious
question. (See (3) for a good account of this process.)

One can incline towards one of two views here: to the State-
Monopoly Capital view, which sees the re-alignments as
necessitated by the falling rate of profit and the emergent
state/finance capital monopoly requiring more and better
trained semi-skilled and supervisory labour; or to the
Poulantzian view, which sees the re-alignments motivated by
an economy moving towards intensive rather than extensive
exploitation and the need for an expanded, intensified and
diversified control over labour power (4).

Either way, the emerging (total) strategy would seem to
require a far-reaching reform of black education, in the form
of De Lange heralding two major threats to the ruling block
as presently constituted. The first is an economic threat to

the worker/petty bourgeosie faction, primarily in the form of competition. The second is a cultural threat to the whole notion of Afrikaner identity which has always defined itself vis-a-vis its psycho-social distance from 'the black man'. The approaching re-alignment in the economic base described above is being strenuously resisted by the 'conservative' faction in terms central to the cultural domain; indeed, the 'conservative' faction has 'always selected as its chosen terrain of struggle, and as the best means to defend its interests, its claim to constitute the authentic voice of the "Afrikaner volk"' (5).

It is in this context of the 'struggle for reform' that De Lange should be seen, and the terms of issue at the Volkskongres (VK) understood. For although the re-shuffle in the economic domain seems to be well in progress, which faction can claim the authentic voice of the 'volk' is still hotly disputed.

The above analysis would suggest that the 'conservative' faction must go all out to block De Lange by emphasizing its potential threat to the essence of Afrikanerdom. More interesting was the 'reform' strategy required to win sufficient consent for De Lange at the VK. It would have been very difficult to counter the 'conservative' faction on its 'chosen terrain'. It would also have been foolhardy to introduce too many 'non-volks' arguments, since these could all too easily have been labelled as 'foreign to the Afrikaner'. What was called for was an intricate process of consent- construction, (6) while beginning to nudge Afrikaner common-sense thinking about education into line with the changing dispensation. A new kind of discourse had, in other words, to be forged which would somehow absorb the surfacing contradictions without completely rupturing the accord that was essential for a reform policy to be passed and a reform practice to be implemented.

The current common-sense thinking about education has been enshrined in the Eiselen Commission report, which was to the 1948 alliance what De Lange is to the new dispensation. It was primarily concerned to protect 'conservative' interests/ identity by using education to block black advancement.

> No proposal for a plan of Native education would
> be likely to commend itself to the sense of the
> great majority of the (white) people of this
> country that did not contemplate the ultimate
> place of the Native as that of an efficient worker...
> (7)

53

It was this tenaciously held tenet of common-sense that had somehow to be shifted at the VK for De Lange to even get a hearing. This was a formidable task, considering that the assembled cultural spectrum of Afrikanerdom - including the churches, teachers organisations, labour organisations, women's organisations, and politico-cultural organisations like the Voortrekkers and the Rapportryers - were all still anchored, to a greater or lesser extent, in the 1948 alliance. Nevertheless, some 1 621 delegates packed into the UOFS'S Callie Human Hall to generate Afrikanerdom's response to De Lange. This paper will examine the machinery of consent-construction that gave shape to the course of the VK. This event will be examined from two points of view: first, the regulations and structures built into the organisation of the congress itself; and secondly, the processes of discursive struggle and transformation waged at the heart of the debate in Bloemfontein.

2   Organisation of the VK.

(i)   Level of control

There were three distinct levels of control at the VK. There was first of all the steering (reelings) committee chaired by Ds DJ Viljoen (NGK) with three deputy chairmen: Prof H Maree (president of the TO), Mr H Sloet (former president of AHI) and Dr JT van Wyk (affiliation unknown). It was their job to set regulations for the smooth running of the congress - from telling the 1 621 delegates not to turn their programme pages at the same time so as not to deafen the speaker, to setting the limits for speaking time. At the second level was a resolution (besluite) committee, whose job it was to transform the multiple motions of delegates into 'representative' motions designed for mass approval. On this committee sat Prof F vd Stoep (De Lange executive committee from Pretoria University), Mr K Steyn (general secretary of the TO) and Prof HB Kruger (affiliation unknown). The overall congress chairman was Prof W Mouton whose main job was to act as a super-rapporteur, summing up the main opinions of the congress on the final day.

The most noteworthy point about these control mechanisms is that they predominantly represent the academic sphere, with one from the business sector and one from the churches.

(ii) Composition

It is not clear who performed the job of deciding which organisations composed the cultural constellation, or how many delegates each organisation could send. This was

crucial since the 'voice of the volk' was to be decided by computer ballot. Differences at this level were well hidden to begin with by appealing to the old common factor in familiar, reassuring terms. The vote was reserved, therefore, for the 'blanke Christen-Afrikaner wat die volks - en kultuurwaardes wat daarmee saamgaan onderskryf'.

The proportion of delegates from two of the groups is noteworthy: the second largest group, representing about 20% of the delegates, was the teaching profession. It was remarked that very little contribution came from them. TO delegates, in particular, kept a low profile. The largest number of delegates, 55% of them, came from the Afrikaner churches, 40% of them from the NGK. The AGS, a minor church, had the next largest number of delegates, and the HK the least. The NGK and the HK have been major forces in the formation of the cultural and political aspirations of Afrikanerdom, especially during the pre-war depression. It was these churches who introduced the notion of 'volkskongresse', becoming major spokesmen 'on educational and social matters of an economically destitute, politically immature and relatively powerless people' (8).

In this time of renewed upheaval in the Afrikaner ranks, it is the churches who have again come forward to heal the breach in terms of trans-political and predominantly old-alliance cultural imperatives.

This probably accounts for the reduced number of delegates from the HK, a church which has traditionally been theologically and politically conservative, and has often openly identified with the 'conservative' faction. The case of the NGK is more ambiguous, and it is seen as more 'neutral', although certain allegations from church circles have recently linked the NGK to the 'conservative' faction (9). A small signal of the hidden struggle for votes came from the AGS who rose to speak on one occasion only - to thank the steering committee for the unexpectedly large number of delegates allocated to them, and to appeal to the teaching profession not to discriminate against them, a sure sign of their marginal status in the constellation.

The 'voices' heard most frequently were therefore those of the academics and the dominees. Business of the day centered around prepared papers delivered predominantly by academics. There were six papers delivered in all, and each paper was further given two discussion — introductions, again mostly by academics. Thus the 'voice of the volk' on the distaff side of the rostrum was powerfully sandwiched between prepared motions from the academics and the opinion-moulding function

of the resolution committee. They were allowed to speak from
the floor, to vote and to pass member's motions, though these,
it was made clear, would form no part of the official
response of the VK to De Lange.

A powerful mechanism of voice management had been set up, and
some of its operations bear scrutiny.

(iii) Voice Management

What could and what could not count as a valid voice at the
VK was very carefully managed. At the outset it was going to
be left to Prof Mouton to articulate his version of the
'opinion of the congress', an articulation he had prepared
before the final computer count on the motions. He also went
onto national TV the same evening with substantially the same
story, claiming to represent the congress' opinion.

Illuminating too, was the way the organisers handled the
dramatic events of the first evening; briefly, the
'conservative' faction made a strenuous effort to create a
'voice' from the floor. They did this in two ways - first,
by Ds Louw opposing the computer vote on Prof Landman's paper
on the grounds that the motion was not yet formulated in a
'volks' way; and secondly, by passing numerous motions from
the floor in a tone laden with nostalgia for the old values
and the old accord. They received overwhelming support on
both counts, amid tumultuous, emotional applause. The
resolution committee was hastily convened and sat up most of
the night, to emerge the next morning with the following:
the motion passed to stall the computer voting system was
adjudged a matter of opinion (meningspeiling), not a vote
(stemming) binding on congress. There would from now on be
limited speaking time after each paper. The local press had
also picked up the names of the conservative speakers, and
the Friday morning's Volksblad listed them all, branding
them "rebels" and "hijackers". Ds Louw took no further part
in the VK, and later left.

It must be said that this in no way implied a victory for the
'reformists'. There were two imperatives for the VK, the
first being simply that they must offer a unified opinion to
forward to the Minister, the second being that they must at
least support the Cabinet's White Paper on De Lange. The
task at hand was not to counterpose a 'reformist' ideology
in place of a 'conservative' one. When this was done, as
for example by an academic from UPE, he was greeted by a
stony silence. Indeed, it is difficult to frame an account
which does not incline towards a theory of 'conspiracy'.
The point is that once a discursive unity is breached, it

takes much discursive wrangling to forge a new unity and to
win consent for it. In the meantime, the old unity must not
be too decisively contradicted, since this would only lead
to polarisation and to a flight back into the familiar
common-sense. The struggle in the discourse is therefore a
slow and unobvious one, but it is here that the work of
popular re-alignment takes place.

3   Discursive conflict and its transformation

(i)   The 'dual repertoire' (10)

The discursive task for the VK was to bind the 'conservative'
discourse of 'harking back to the old alliance' (11) -
including appeals to history, tradition, the unity of the
thirties, 'ons volk glo mos nie aan dié ding nie' (12) and
so on, into a 'relation of precarious congruence' (13) with
the regulative and technical requirements of De Lange. This
meant incorporating the 'dual repertoire' into a unitary
voice, by transmuting and deflecting the grossest
contradictions via certain discursive strategies.   This was
to be essentially a holding operation, as much a prevention
of dissent as a winning of whole-hearted consent.

The 'dual repertoire' in De Lange took mainly the forms of
communality versus diversity, and education as socio-cultural
versus education as technical-vocational. The delegates were
distinctly confused by the contradictory aims, and they
responded in contradictory ways.

Although 53.97% of the delegates believed equal standards
would lead to a lowering of white standards, 67.94% voted in
favour of the principle of equal standards.

Even though 87.32% felt that commonality should not be
stressed above diversity, 77.28% felt that there is not
necessarily a conflict between the two.

96.67% wanted the control of white education to remain in the
hands of the whites; nevertheless, 53.95% supported the
creation of a coordinating structure at the first level
(De Lange's 'one ministry').

In the winning words of Prof HJS Stone, 'ons
onderwyspaaltjies het nie dwarsbalkies op nie' (14). The
persuasiveness of this metaphor lay in the insinuation that
the 'bails' (a coordinating structure) would precipitate no
alteration in the individual 'wickets' (separate educational
structures), a good example of the discursive deflection of
contradictions.

57

(ii) 'politiek-praters' versus the rest

Although every delegate at the VK was probably aware of the 'real' issues, the congress was constantly diverted away from these community-splitting terms towards more 'neutral' and unifying territory. Ds Viljoen launched the VK thus: 'Die toekoms van die onderwys word nie op politieke wyse en vanuit politieke standpunte benader nie, maar vanuit 'n opvoedkundige en Christelike perspektief'   (15). Prof C Boshoff was stung to retort that 'a neutral family does not in fact exist, and neither does a neutral education authority'   (16). The discursive task was therefore to drive a wedge between the 'politiek-praters' (17) and an undefined rest who would come to form the silent majority of the 'volk' by default, the press playing an active role here. In a burst of alliterative enthusiasm, The Citizen saw 'leftist liberals' as well as 'rightist radicals'. (18), but 'uiteindelik het gebalanseerde realisme in hoofsaak geseevier' (19), an implicit ascription of imbalance and unreality to the 'politiek-praters'. Prof Mouton had discovered, by show of hands, that only 35% of the delegates had read the De Lange Report before the VK. This allowed him to speak of 'opvoedkundiges' on the one hand who were not always understood by ''n deel van die gehoor'   (20). The press continued this process of conflation and marginalisation (Poulantazas' 'isolation effect' (21), talking of a 'ver-regse groepie' (22), a 'lawaaierige minderheid' (23), and 'onkundige stofopskoppers wat bolangse aandag getrek het', maar...' (het) die deskundiges op die ou end die leisels vasgevat'   (24).

Prof Mouton and the SABC continued to naturalise the discursive struggle into the received 'story' of the VK: 'Political moves failed after educationally-motivated arguments were put forward'. 'We had political overtones, but as we moved on, it became an educational conference' (25).

From these few examples it can be seen how the efforts of the 'conservative' faction to bring Afrikanerdom's contradictions to the surface were deflected by the construction of discursive identities which systematically re-routed the debate.

(iii) Cultural cacography

The evident confusions, and the latent rifts in the Afrikaner alliance could not be left in the terrain of identity. The identity displacements were strategically too specific to be lasting. The second step of the discursive transformation was to re-construe the difficulties of the alliance as

difficulties of discourse; to present the rift in the
alliance as a lack of discursive closure. Mr. Sloet spoke
of the 'tremendous complexity of education provision' (26).
A masterly statement came from Prof Mouton: 'Die dilemma vir
die Afrikaner is dat die antwoorde wat hy op die probleme
ontvang, nie meer so eenvoudig as in die verlede is nie. Meer
as een antwoord word deur sy eie mense vir hom aangebied'
(27). Differences in alliance, interest and identity are
presented as different discursive slots ('antwoorde'), they
are problematised ('meer as een' and 'nie meer so envoudig')
but the category of identity is left intact ('die Afrikaner'
and 'sy eie mense'.)

Keeping this intact depended on two tactics. The first was
banging 'the Afrikaner'/'the volk' drum long and loud enough
for the traditional massiveness of the singularity to eclipse
the latent plurality. The largest 'yes' vote (96.89%)
recorded support for a 'Christelike volkseie (nationale) en
kultuurgebonde onderwys vir die kinders van Christen-ouers
nou en in die toekoms'. (Indeed, who could have dared to
vote against it?) And it was left to Prof Mouton to narrate
the orthodoxy - which on the one hand admitted discursive
differences whilst at the same time asserting that 'as the
conference proceeded, we united more and more' (28). The
second tactic was to rally 'the Afrikaner' around neutral
flags. A motion deploring the dropping Afrikaner birthrate
was unanimously accepted, and much discussion surrounded the
founding of an Afrikaner 'parents' association'. Amidst all
this, the Cabinet's White paper on De Lange was accepted by
87.56%, and the small step forward had been achieved, whilst
maintaining some sense of identity and cultural continuity,
a formidable orchestration of confusion and conflict into 'a
coherent dissonance... a distinct cacography' (29).

4   Resumé

The voting tallies show that the delegates must have voted
for mutually contradictory motions. Confusion reigned, but
so did a certain essential cultural unity. The re-alignment
in the base was not permitted to become a feature of debate
at the VK. Again, it must be emphasized that this,
'engineering of consent', is not a conspiracy... it is
something that is generated both out of the altered alliances
that are being constructed and ... out of the contradictory
imperatives of the... apparatus itself' (30). The last
words fittingly belong to Prof Mouton: 'Kom ons luister na
mekaar, kom ons waardeur mekaar en kom ons probeer saam om
oplossings te vind tot eer van ons hemelse Vader' (31).

The 'volk' could only say amen.

items for the 'Notices' section, and so on.

Contributions should be sent to:

Wally Morrow   Michael Gardiner
Department of Education   Department of English
University of the   OR   Johannesburg College of
    Witwatersrand   Education
PO Box 1176   27 St Andrew's Road
Johannesburg   Parktown
2000   2193

Contributions should not ordinarily exceed 3000 words in
length, and should be typewritten on one side of A4 paper,
double spaced, with ample margins. Two complete copies
should be submitted. Proofs will not be sent to authors for
correction unless this is explicitly requested.

There is to be no separate 'Bibliography". References should
be kept to a minimum. All notes (which includes 'footnotes'
and references) are to be numbered consecutively in the text
(in Arabic numerals, in parenthesis, on the line of the text),
and should be listed at the end of the article, as 'Notes'.
Titles of papers or chapters cited are to be enclosed in
double quotation marks; titles of books are to be underlined.
Examples:

Notes

(1)   Carole Pateman Participation and Democratic Theory,
      Cambridge: Cambridge University Press, 1970.

(2)   PF Strawson "Freedom and Resentment" in Freedom and
      Resentment and Other Essays, London: Methuen, 1974,
      pgs 15-23.

(3)   L Althusser "Ideology and Ideological State Apparatuses"
      in BJ Cosin (ed) Education, Structure and Society,
      Harmondsworth: Penguin, 1977, see pg 81.

Substantial quotations (more than about 3 lines) should be
indented, shorter quotations should be enclosed in single
quotation marks. Omissions from a quotation should be
indicated by three dots.
