

Understanding Working Memory

Robyn Milligan

(Adapted from Professor Susan E. Gathercole & Prof. Tracy Packiam Alloway)

What is working memory?

Working memory describes the ability we have to **hold in mind and mentally manipulate information over short periods of time**. Working memory is often thought of as a mental workspace that we can use to store important information in the course of our mental activities. A good example of an activity that uses working memory is mental maths.

When do we use working memory?

Mental maths is just one example of an activity that relies on working memory. Other examples from everyday life include:

- Remembering a new telephone number, a PIN number, web address or a vehicle registration number while we are trying to find a pen and paper to write it down or to use it in some other way
- Following spoken directions such as 'Go straight over at the traffic circle, take the second left and the building is on the right opposite the shops'
- Calculating how much the bill will be at the Pick 'n Pay checkout for the items we have in our basket.
- Remembering the unfamiliar foreign name of a person who has just been introduced to you for long enough to enable you to introduce them to someone else
- Measuring and combining the correct amounts of ingredients (e.g. rub in 50g of margarine and 100g of flour, and then add 75g of sugar) when you have just read the recipe but are no longer looking at the page.

Why is working memory important in classroom learning?

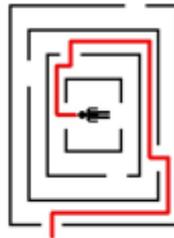

Many of the learning activities that children are engaged with in the classroom, whether related to reading, mathematics, science, or other areas of the curriculum, impose quite considerable burdens on working memory.

3. Visual Working Memory

This refers to the visual parts of working memory. It is your child's mental 'notebook' where they store temporary information that they can see. To improve your child's visual working memory, play the following games

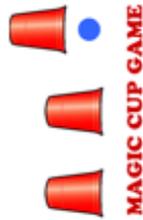

a. Mazes in the sand

Encourage your child to take 'mental' photographs of designs that you draw, and then get them to copy them after a delay of a few seconds. Make the designs more complicated as they get better.

b. Magic Cup Game

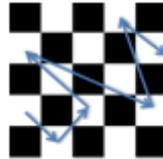

Hide different objects under cups and after switching them around, get your child to remember what object was in what position.

MAGIC CUP GAME

c. Follow the Leader

Encourage your child to copy you as you point out a sequence of dots/bricks/tiles/stones. Make the length of the sequence longer and longer as your child gets better and better at it.

d. Memory Games

Place a few household items on a tray, and cover them with a cloth (pillow case, dishcloth). Give your child 30 seconds to have a look under the cloth. After that, cover it up again, and get your child to remember what the objects were (i.e. bottle top, soap, cell phone, spoon, pen). As he gets good at this, increase the number of objects that he has to remember. Later, get him to remember both the name of the object and its location on the tray (two processes at the same time).

To improve your child's verbal working memory, play the following games with them:

Play Copy-Cat

- Get your child to repeat after you as you say more and more complex sentences, or lists of words.
- Ask your child to listen to a list of names that you call out, and get them to remember them in order. Make the lists longer and longer each time your child masters a level. Start with related objects (apple, banana, orange, pear), and then make it more complicated by including unrelated objects (one, frog, hat, seven, run, pink, cheese).
- You can also increase their numerical skills by using lists of numbers to improve their abilities (i.e. one, five, seven, three). Make the task more complicated by asking your child to remember the number sequence backwards (i.e. You say '1, 5, 7' and your child says '7, 5, 1').

Memory Story Games

Read or tell your child stories. Ask them to remember the names of the characters, and get them to tell them to you at the end.

Later, ask them to keep track of two components in the story (i.e. the types of animals in the story, and what they each did). This requires your child to keep track of two mental processes at the same time.

This skill can be developed while listening to the radio, watching soccer or listening to the commentary. The aim is to get the child to remember details that they hear, and then remember them long enough to say them back to you.

The radio said that Gaxa passed upfield to Serero, who hooked the ball Mphela. He scored with his left foot, straight at goal.

Activities often require the child to hold in mind some information (for example, a sentence to be written down) while doing something that for them is mentally challenging (such as spelling the individual words in the sentence). These are the kinds of activities on which children with poor working memory struggle with most, and often fail to complete them properly because they have lost from working memory the crucial information needed to guide their actions. As a result, the children may not get the learning benefit of successfully completing an activity, and this slows down their rates of learning.

Working memory is also needed to help us remember where we have got to in a complicated mental activity. Consider the case of a child with low working memory capacity attempting to follow the teacher's instructions to write down a sentence she has just spoken. The child not only needs to hold the sentence in working memory for sufficiently long to guide his or her attempts to write the individual words, but needs to remember how far they have got in this attempt, and to find the next word in working memory. Although to skilled writers this seems like an easy task, children with poor working memory capacities find this extremely difficult, and often either skip or repeat words and letters as they lose their place in this demanding mental activity.

What can you do to improve your child's working memory capacity?

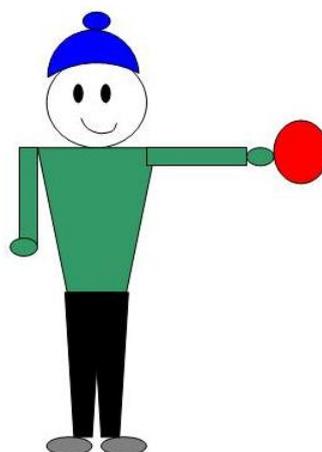

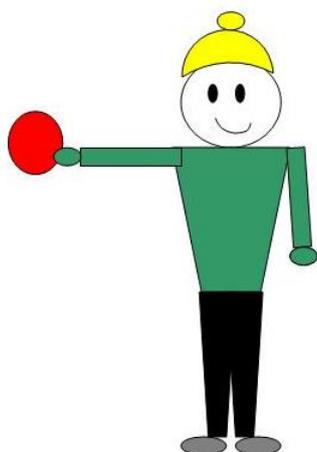

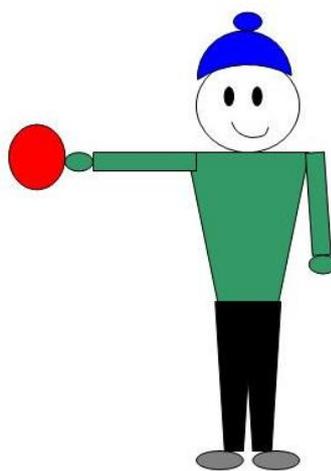

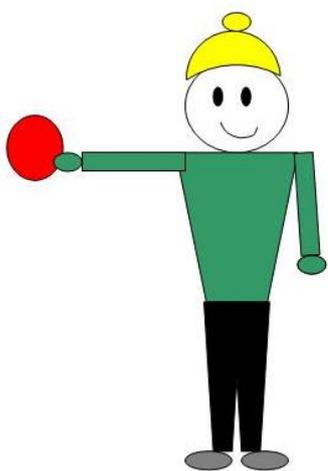

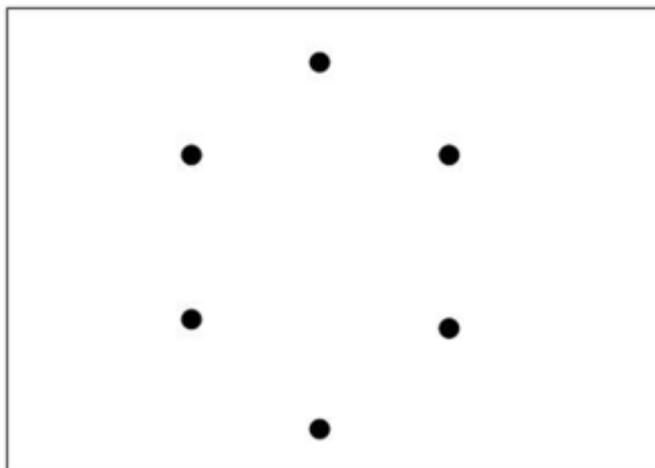

1. Monitor your child's working memory load.
 - a. After giving an instruction, ask your child to repeat it to you, or tell you in what order they will carry out the task.
 - b. If they have forgotten the instruction, repeat the information
 - c. Break down tasks and instructions into smaller parts to minimise memory load
 - d. Encourage your child to ask the teacher more information when they have forgotten

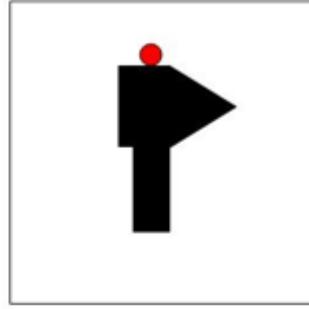

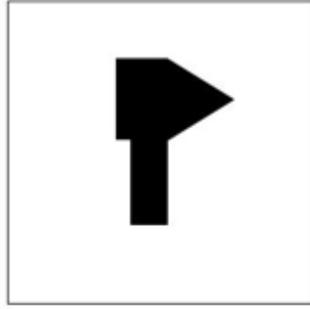

2. Verbal Working Memory

This refers to the language and hearing parts of working memory, and includes tasks like remembering and carrying out two auditory instructions at the same time.

Appendix B

Small Laminated Cards of Mr X and Spatial Recall

Appendix C

Standardised Testing Procedure

Inviting participation:

- Approach individuals, explain the study and invite them to participate.
- Please remember to make a big fuss of the parents by thanking them, and give them very broad feedback on their child's performance from the report.
- Also, let's be more vigilant about doing referrals for speech etc as they happen. We are ethically liable for missed referrals.

Testing

AWMA

1. Administer all the practice items in all subtests, except Listening Recall, Mr X and Spatial Recall.
2. Then if the child aces the practice items, jump them up to start at level 2 or 3 (use your discretion) to preserve their attentional resources and interest for longer. You can always jump down if it's too advanced.
3. In the case of Listening Recall, Mr X and Spatial Recall, administer all practice items if the child has the capacity to understand what is going on. Please use the visual aids that we piloted for this process. If they do not understand the multiple processes, and you feel like you are hitting your head against a brick wall, skip the two-part section of the practice round and just start at level 1. If they pass level one, you can re-explain how they can manage the second level.

RCPM

1. Let's make a rule that in the case of poor language comprehension, you offer the child the corrected version in the first three attempts of each set. i.e. they make their choice, but you explain why it is correct or not for the first three. This allows them to self-correct if they don't understand the instructions.
2. Discontinuation Rule: The book says that in order for the subtest to be valid, they must get the first 5 correct. I think we stretch this to 8. If they have got the first 8 incorrect, discontinue and start the next set. We will score it properly, but for now, just record the raw scores in each subtest.

Sentence Repetition

1. Because of the conflation of auditory memory for a foreign language and English proficiency, let's agree that each sentence can be said twice in order to try and compensate for memory.
2. Accuracy in scoring is very important to create variance, so that this can be used statistically.

Demographic Questionnaire

1. Let's try note handedness on the form (R, L or U). Let's try make sure that the computer is in the centre of the child's visual screen. Take note of incongruencies between pointing and writing of name.
2. Please try and remember also to ask mom where she gets her medication from in order to gain access to her file.
3. Try and fill in child's HAART scores while you have the file.

Dear Parent/Guardian,

I am a counselling psychologist currently completing a PhD at the University of the Witwatersrand and am conducting research into the effect of HIV and anti-retroviral therapy on the development of thinking and learning. This will help us to know if there are things that can be done to children affected by the disease to learn better at school. In order to understand whether these differences are due to the disease and its treatment, we need to measure them against children who are *not* infected or exposed to the virus. This is why you have been asked if you would like to participate in the study, as you will form what we call a control group.

What is required of participants?

If you would like to be a part of this research, I would need, with your permission, access to your child's and their mother's hospital file to see your child's medical history, and their health while they were not yet born. Part of this research also requires your responses on the questionnaire below, as well as allowing your child to undergo three brief psychometric tests. The Ravens Coloured Progressive Matrices (10 minutes) asks the child to identify 36 missing puzzle pieces from coloured pictures. The Automated Working Memory Assessment (60 minutes) is a computer programme that asks children to move and think about characters, shapes and words. Thirdly, the Sentence Repetition Test (10 minutes) requires children to repeat 16 English sentences after me. Testing should take no longer than an hour and a half of your time. The questionnaire can be filled in by yourself, or with my help, either before, during or after the assessment. *This study does not require you or your child to have blood tests of any kind.* I would therefore like to invite you to participate in this research, and give permission for your child to participate in the study.

What you can expect from the researcher:

Your responses, results and medical information will remain confidential, and no-one other than myself will be able to link your name to your results. Should the psychometric tests identify severe academic problems in your child, you will be referred to the local psychology department for further assistance, should you wish. Your child will also receive light refreshments during the assessment. Completion and return of the questionnaire will be considered to indicate permission for me to use your responses for the research project. Participation of both you and your child is voluntary. Should you choose not to participate, this will not be held against you in any way, and

you will not be treated differently at the clinic when you next come to get your medication. You and your child are also allowed to withdraw from the study at any time, and will not experience any negative consequences. The results of the study will be given to the doctors at the unit, and you are welcome to talk to them about what they mean. I will also be available to discuss the general results should you wish to see me about them.

If you have any further questions or require feedback on the progress of the research, feel free to contact me. My contact details appear below my signature.

Thank you for considering taking part in the research project. Please detach and keep this sheet.

Kind Regards,

Robyn Milligan

Hello,

My name is (Robyn/Brittany/Fatima), and I am studying at university. I am trying to find out some things about the way children think and learn. I would like to invite you to join me in finding these things out.

If you decide that you would like to be a part of this, you will need to do three jobs. The first job is a book of coloured puzzles where you need to find the missing puzzle piece. The second one is a job on my computer where we will look and listen to different words and pictures together. The last job is where you and I play copy-cat with 16 English sentences.

It's your choice to do these jobs or not. If you decide that you will do them, you can have as many breaks as you like, and I also have a little snack for you half-way through so you don't get tired. If you decide in the middle of the jobs that you don't want to carry on, that is OK. Nothing bad will happen and you will be free to leave the hospital and go home.

Are you happy to help me with my study and do these three jobs with me?

Summary of ARV Drug Safety Side Effects

Table K1

Summary of ARV Drug Safety Side Effects

Antiretroviral Class	Drug Name	Paediatric Indication	Specific Drug Adverse Effects	Class Adverse Effects
NRTI's/NtRTI's	Abacavir (ABC)	>3 months	Serious and sometimes fatal hypersensitivity reactions	Mitochondrial dysfunction including lactic acidosis, hepatic toxicity, pancreatitis, and peripheral neuropathy.
	Didanosine (ddl)	Yes		
	Emtricitabine (FTC)	>3 months	Skin discolouration, fat redistribution	
	Lamivudine (3TC)	Yes	Anaemia, Neutropenia, fat redistribution	
	Stavudine (d4T)	Yes	Fat redistribution	
	Tenofovir (TDF)	No	Osteomalacia and reduced bone density, renal toxicity	
	Zidovudine (ZDV, AZT)	Yes	Bone marrow suppression, myopathy, fat redistribution	
NNRTI's	Efavirenz (EFV)	>3 months	Neuropsychiatric effects	Rare, but potentially life-threatening cases of skin rash, including Stevens-Johnson syndrome and hepatic toxicity.
	Etravirine (ETR)	No		
	Nevirapine (NVP)	Yes		
Protease Inhibitors	Atazanavir (ATV)	>6 years	Elevations in indirect bilirubin, cardiac conduction abnormalities	Metabolic complications including dyslipidemia, fat maldistribution, insulin resistance.
	Darunavir (DRV)	>6 years	Skin rash, elevated hepatic transaminases	
	Fosamprenavir (f-APV)	>2 years	Life-threatening rash, neutropenia, elevated serum creatinine kinase	
	Indinavir (IDV)	No	Hyperbilirubinemia, rash, nephrolithiasis/urolithiasis	
	Lopinavir (LPV)	Yes	Cardiac conduction abnormalities	
	Nelfinavir (NFV)	>2 years		
	Ritonavir (RTV)	>1 month		
	Saquinavir (SQV)	No		
	Tipranavir (TPV)	>2 years	Hepatitis	
Fusion Inhibitors	Enfuvirtide (T-20)	>6 years	Local injection site reactions, local site cellulitis	
Entry Inhibitors	Maraviroc (MVC)	No	Rash, musculoskeletal symptoms	
Integrase Inhibitors	Raltegravir (RGV)	No	Abdominal pain, vomiting, rare systematic allergic reaction, hepatitis
