SCINTIGRAPHIC ASSESSMENT OF CARDIOVASCULAR DISEASES IN ASYMPTOMATIC DIABETIC BLACK PATIENTS

Mboyo Di Tamba Willy Vangu

A thesis submitted to the Faculty of Health Sciences, University of the Witwatersrand,
in fulfillment of the requirements for the degree of
Doctor of Philosophy

Johannesburg, 2011
DECLARATION

I, Mboyo Di Tamba Willy Vangu declare that this thesis is my own work. It is being submitted for the degree of Doctor of Philosophy in the University of the Witwatersrand, Johannesburg. It has not been submitted before for any degree or examination at this or any other University.

Assessment of therapy response in Non Small Cell Lung Cancer with F-18 FDG PET
ABSTRACT

The association between diabetes and coronary artery disease (CAD) has been recognized as a major public health problem in the developed world. While there is an increased prevalence of silent myocardial ischaemia among asymptomatic individuals with diabetes, diabetic individuals with CAD in their larger number are usually asymptomatic, and when they present with signs of disease, there is extensive and severe CAD. It should be noted that amongst black South African, ischemic heart disease (IHD) remains rare, and there is little data linking diabetes mellitus with IHD. However, contrary to early reports that have suggested a low prevalence of CAD in black population in Africa, many studies have indicated a rapid change on the spectrum of CAD in numerous parts of the African continent. Despite the emerging report of high prevalence of risk factors there are only limited data investigating prevalence of CAD in black African with diabetes.

The purpose of this thesis was to use myocardial perfusion imaging (MPI) at rest and after stress testing to detect CAD in a group of asymptomatic black patients suffering from diabetes and therefore assess the prevalence of CAD; to assess the changes in myocardial perfusion in asymptomatic diabetic black individuals and compare the differences seen in myocardial perfusion changes between the asymptomatic diabetic black and, the asymptomatic diabetic white and Indian individuals; to include data from symptomatic diabetic patients who were referred for MPI as part of their routine clinical management for possible comparison.

Consecutive 94 asymptomatic diabetic black patients and 50 asymptomatic diabetic white and Indian patients were recruited from the outpatient diabetic clinic of the Johannesburg hospital. Data from 90 subjects forming a group of symptomatic diabetic patients, 45 blacks and 45 whites and Indians referred for MPI as part of their clinical management were also analyzed. A two-day protocol for SPECT MPI was used in all participants: on the first day the stress testing
MPI while the rest MPI was consistently done on the second day. Both exercise and pharmacologic stress testing were used. Technetium-99m methoxy-isobutylisonitrile (MIBI) was used as the myocardial perfusion radiopharmaceutical. Myocardial perfusion was assessed by means of semi-quantitative scoring system to measure the extent and severity of perfusion abnormality. Visual inspection of the reconstructed SPECT MPI images was carried out to assess perfusion deficit where there was a doubt on the extent and severity of perfusion abnormality. The QPS/QGS software allows obtaining resting and post stress left ventricular ejection fraction (LVEF). The means and percentages on study variables were obtained. The Spearmen correlation coefficient was used to calculate correlations between variables. The Kruskal-Wallis test was used to assess differences between black diabetic and white or Indian diabetic patients and Wilcoxon scores (rank sum) two-sided were used to measure differences within these racial groups.

There were 123 females (52.6%) and 111 males (47.4%) in total. From the recruited participants, 53 (56.4%) asymptomatic females and 41 (43.6%) asymptomatic males were blacks whereas 24 (48%) asymptomatic females and 26 (52%) asymptomatic males were whites or Indians. The symptomatic group was comprised of 26 (57.8%) female and 19 (42.2%) male black patients and 20 (44.5%) female and 25 (55.5%) male white or Indian patients.

Asymptomatic diabetic black participants were younger than the participants from the asymptomatic diabetic white and Indian group with a mean age of 60 (SD±7.2) years Vs 64 (SD±7.7) [p=0.003].

Fourteen percent of asymptomatic black participants had evidence of ischaemia by showing improvement of perfusion on stress testing versus twenty eight percent of white and Indian asymptomatic participants (p=0.62).

Perfusion defects that did not change from rest to post stress testing MPI (fixed defects) were also noted in 20% of asymptomatic black and 26% of asymptomatic white and Indian diabetic participants. These fixed perfusion...
defects are indicative of previous myocardial infarctions and therefore suggestive of CAD.

No significant difference was noted on the changes of perfusion that could account either for ischaemia or infract between asymptomatic diabetic black participants and their white and Indian counterparts (p=0.47). The difference on the improvement of perfusion from rest to post-stress MPIs or reversibility of perfusion to suggest only the presence of ischaemia did not also show a significant difference between these two racial groups (p=0.62).

Our data demonstrated a high prevalence of CAD in asymptomatic diabetic black participants similar to other racial groups. Our study has demonstrated evidence to recommend screening of asymptomatic diabetic black individuals in equal manner than other races for the detection of CAD. More importantly, stress MPI should be routinely used as a noninvasive investigation in our environment and be utilized more actively in the management of all asymptomatic diabetic patients.
My gratitude is with the following people:

- My wife and daughters who accept to sacrifice uncountable number of weekends to let me work with almost no social time for them
- Professor J Kalk for igniting the urge in me to start this work
- Professor MD Mann for his continuous support throughout my career
- Professor K Sliwa for accepting to finalize the supervision of this thesis
- Doctor E Libhaber for giving her time to analyse data for this study
- The staff of Nuclear Medicine at the CM Johannesburg Academic Hospital for their willingness to contribute to the success of this study.
  My special thanks go to Dr N Mkhize for all the effort and dedication in the selection of participants.
- I finally thank God for giving me strength to persevere in collecting data, analyzing them and typing the entire work myself.

Chapter 1: Introduction and review of literature 1

1.1 Background 1

1.2 Diabetes and Cardiovascular disease (CVD) in Africa 1

1.3 Role of screening asymptomatic patients in Africa 3

1.4 Screening asymptomatic patients for CAD 5

1.4.1 Exercise testing 5

1.4.2 Myocardial perfusion imaging (MPI) 7
| 1.4.2.1 | Value of SPECT in MPI | 8 |
| 1.4.2.2 | Indication of SPECT perfusion imaging | 9 |
| 1.4.2.3 | Stress testing for MPI | 10 |
| 1.4.2.3.1 | Pharmacologic stress testing for MPI | 11 |
| 1.4.2.3.2 | Exercise versus pharmacologic stress testing | 14 |
| 1.4.2.4 | Role of quantification | 15 |
| 1.4.2.5 | Prognostic value of MPI | 18 |
| 1.4.2.5.1 | Meaning of normal stress MPI | 19 |
| 1.4.2.5.2 | Stratification of a high-risk population | 21 |
| 1.4.2.5.3 | MPI as Predictor of cardiac death | 23 |
| 1.4.2.5.4 | MPI in revascularized patients | 24 |
| 1.4.2.5.4.1 | After coronary artery bypass graft (CABG) | 24 |
| 1.4.2.5.4.2 | Post percutaneous transluminal coronary angioplasty (PTCA) | 26 |
Chapter 2: Methods

2.1 Study objectives

2.2 Ethical issues

2.2.1 Informed consent

2.2.2 Confidentiality

2.3 Methods

2.3.1 Recruitment of patients

2.3.2 Inclusion criteria

2.3.3 Exclusion criteria

2.3.4 Study visits

2.4 Protocol

2.4.1 Method

2.4.2 Techniques

2.4.3 Blood sampling

2.5 Assessment of images and interpretation

2.6 Statistical analysis
Chapter 3: Results

3.1 Baseline information of the study population

3.2 Changes in myocardial perfusion

3.2.1 Asymptomatic diabetic participants

3.2.2 Symptomatic diabetic subjects

3.3 Biologic markers and MPI findings

3.3.1 Asymptomatic diabetic Black participants

3.3.2 Asymptomatic diabetic White and Indian participants

3.3.3 Symptomatic diabetic Black subjects

3.3.4 Symptomatic diabetic White and Indian Subjects

3.4 Differences in myocardial perfusion

Chap 4: Discussion

4.1 Relevance of methodology for detecting ischaemia in African

LIST OF FIGURES

Fig 1. Normal rest and stress MPI in asymptomatic diabetic black participant. Note the lack of perfusion change from rest to stress.

Fig 2. Percentage on the improvement noted on the perfusion from rest to stress MPI in both groups of asymptomatic participants.

Fig 3. Reversibility of perfusion from rest to stress MPI that was consistent with mild stress induced apical inferior myocardial ischemia in asymptomatic diabetic participant. The SDS was 6.

Fig 4. This asymptomatic diabetic participant showed a reversible perfusion consistent with stress induced moderate inferior ischaemia and the SDS was 10.

Fig 5. Severe lateral and inferior stress induced ischaemia with a SDS of 15.

Fig 6. Different degree of perfusion improvement noted in both groups of asymptomatic participants.

Fig 7. No change is noted on the perfusion from rest to stress MPI but there is a large fixed perfusion defect noted in the apical inferior, septal and inferior walls.
NOMENCLATURE

A2A: Adenosine 2A

AHA: American Heart Association

CABG: After coronary artery bypass graft

CAD: Coronary artery disease

cAMP: Cyclic adenosine monophosphate

CD: Cardiac death

CVD: Cardiovascular disease

DIAD: Detection of ischemia in asymptomatic diabetics

ECG: Electrocardiography

EF: Ejection fraction

HbA1C: Glycosylated hemoglobin

HDL: High density lipoprotein

IHD: Ischemic heart disease

LBBB: Left bundle branch block

LDL: Low density lipoprotein
LVEF: Left ventricular EF

MBq: Megabequerel

MI: Myocardial infarction

MPI: Myocardial perfusion imaging

MIBI: Methoxy-isobuthyl-isonitril

PPV: Positive predictive value

PTCA: Post percutaneous transluminal coronary angioplasty

QGS: Quantitative gated score

SPECT: Single emission computed tomography

SD: Standard deviation

SDS: Summed difference score

SRS: Summed rest score

SSS: Summed stress score

3D: Three-dimensional

TG: Triglyceride
THR: Target heart rate

TID: Transient ischemic dilatation
