OSTWALD COLOUR THEORY

This is a theory which endeavors to organize all colors, tones and colors into a diagrammatic scale from true black (black) to white (white), and which is divided into eight primary colors, each of which is represented by a color wheel. The color wheels are arranged in a horizontal section halfway between black (black) and white (white), and in vertical sections taken through the color scale. The primary colors are represented by white, black, and neutral gray.
