Fig. 2.22: (a) Photograph of slickensided bedding surface in a quartzite unit of the West Rand Group in the northern part of the collar (location 1, see Appendix No. 6). Such surfaces are only observed locally, but indicate southeasterly movement of the hangingwall (core-side-down movement). (b) Lower hemisphere equal area stereographic projection (Schmidt net) of the lineations found on the bedding surface (a). The average bedding orientation is also given by the filled circle and great circle.
