Fig. 2.25: Photograph of a road-cut exposing shear zones in shale of the Booysens Formation in the northwestern collar (farm Rooderand, location 2, see Appendix No. 6). Brittle deformation is dominant at this location, increasing towards the traces of the major fault planes (solid lines). Smaller faults with steeper dip angles branch off the main faults (dashed lines). Width of outcrop shown ca. 15 m. See text for further details.
