This MSc dissertation contributed to and expanded on a project carried out for the Department of Water Affairs and Forestry, entitled “The Hydrologic and Hydraulic Study of the Behaviour of the Nyl River Floodplain” (Birkhead *et al*, 2004; Bailey, 2003; Pitman and Bailey, 2003). Allan Bailey of Stewart Scott International and Dr Bill Pitman developed the hydrological model and supplied the virgin and historical catchment scenario flows at the floodplain margin. Dr Andrew Birkhead developed the contour map and hydraulic model of the Nylsvley Reserve and Vogelfontein - Mosdene reaches of the study area. I under Dr Andrew Birkhead’s supervision developed the contour map and hydraulic model of the Middelfontein reach of the study area. Various methods used in the model, such as to determine losses to infiltration and ponding and to determine inundation areas from inflows to each reach were developed by Dr Andrew Birkhead. Prof. Geoff Blight carried out the energy balance measurements used to determine evapotranspiration losses. Various Centre for Water in the Environment (CWE) members collected flow and stage data during this project, and are acknowledged by Birkhead *et al* (2004).

The National Research Foundation (NRF), the CWE, the University of the Witwatersrand and Department of Water Affairs and Forestry (DWAF) funded this project.

I would like to sincerely thank both of my supervisors, Prof. Chris James and Dr Andrew Birkhead for their generous and friendly support, encouragement, suggestions and advice. They have contributed greatly to my development.

I am grateful to Prof. Geoff Blight for his advice and suggestions with the infiltration and evapotranspiration investigations at Nylsvlei. Thank you also to Michael Raum, Fanie Baloyi and my parents Helen and Charles, for their help in measuring the

Acknowledgements

infiltration losses on the Nylsvlei floodplain. I owe thanks to Prof. Andy Fourie for the use of the Guelph Permeameter, Gary Marneweck (Wetland Consulting) for his input on the wild rice, Alan Bailey (Stewart Scott International) for his help with the hydrological modelling and supply of hydrological data and Beyers Havenga (DWAF) for input into different catchment scenarios. Thanks to my friends and colleagues from the CWE Wendy Midgley, Angelina Jordanova, Peter Hirschowitz, Richard Sharpe and Jaco Grobler for their advice and support and to Michael Grant for helping me with writing macros. Thank you to my parents, Charles and Helen, my sister, Elizabeth, to my girlfriend Margaret Archibald and all my friends for their support and encouragement.
