

**INTENSIVE CARE NURSES' KNOWLEDGE OF EVIDENCE BASED
GUIDELINES REGARDING WEANING THE MECHANICALLY
VENTILATED PATIENT**

Jacquie Louise Fischer

A research report submitted to the
Faculty of Health Sciences, University of the Witwatersrand, Johannesburg
in partial fulfilment of the requirements for the degree
of
Master of Science in Nursing

Johannesburg, 2014

DECLARATION

I, Jacquie Fischer, declare that this research report is my own work. It is being submitted for the degree of Master of Science (in Nursing) in the University of the Witwatersrand, Johannesburg. It has not been submitted before for any degree or examination at this or any other university.

Protocol number: M130732

DEDICATION

Special dedication to all my family, friends and colleagues for their patience, encouragement and support for the duration of my studies at the University of the Witwatersrand, Johannesburg.

ACKNOWLEDGEMENTS

My appreciation extends to the following people and institution:

To my supervisor, Shelley Schmollgruber for her dedication to the profession of nursing,
and for all her support, encouragement and guidance.

To my husband Gary and daughter Isabella for their patience, encouragement and
understanding.

To all the ICU nurse experts for their valuable time and contribution toward the
validation of the instrument used in the study.

To the institution where the research was carried out and the relevant personnel of
this institution.

To Professor Pieter Becker (MRC Statistician) for his valuable input into the
statistical analysis and interpretation of the data.

ABSTRACT

Evidenced based practice (EBP) guidelines have been developed to reduce variation in weaning, provide quality of care and patient satisfaction. Nurse led weaning has been shown to reduce weaning time, and therefore it was important to identify whether nurses have sufficient knowledge to implement EBP regarding weaning (Hansen, Fjaelberg, Nilsen et al, 2008);(Crocker, 2002:272). Weaning protocols are associated with 25.0% reduction in the duration of mechanical ventilation time, a 78.0% reduction in weaning duration, and 10.0% reduction for length of stay in ICU (Blackwood, Alderdice, Burns et al, 2011:9). The purpose of the study was to evaluate and describe intensive care nurses' knowledge of EBP guidelines with regard to weaning the mechanically ventilated patient. Five adult intensive care units at two tertiary public sector academic hospitals were used to conduct the study in order to determine barriers to EBP.

A non-experimental, descriptive, prospective two-staged design was utilized in this two part study. In *Stage I* of the study, the sample size comprised six (n=6) specialist expert members selected from the ICU's at the study site using a non-probability purposive sampling method. In *Stage II* of the study, the sample size comprised eighty (n=80) intensive care nurse respondents selected from the ICU's using simple random sampling. The data collection instrument developed by the researcher comprised 40 items relevant to nursing practice derived from EBP weaning guidelines. Respondents were asked to rate all the items independently using a 4-point Likert scale.

Findings indicated that intensive care nurses lack adequate knowledge on weaning the critically ill patient from the mechanical ventilator. The Dreyfuss model of skill acquisition shows that improved skill performance in nursing is based on experience as well as education, yet this study showed the opposite (Dracup & Bryan-Brown, 2004). Years of experience did not influence nurses' knowledge level, as there was no statistical difference in these items. Differences in knowledge scores between the primary nurse and shift leaders were minimal, although significant ($p<0.05$), indicating that shift leaders were more knowledgeable than primary nurses.

LIST OF TABLES

2.1	Selected recommendations for weaning and ventilator discontinuation from the American College of Chest Physicians (Taskforce)	28
2.2	Weaning classification based on clinician experience but not literature data	29
2.3	Commonly listed criteria for discontinuation of a weaning trial	35
2.4	Factors associated with extubation failure	38
4.1	Frequencies obtained for demographic data	63
4.2	Frequencies obtained for factors predicting weaning failure	69
4.3.	Summary for Fisher's exact test for frequency distribution of knowledge for selected demographic variables by weaning protocols	109
4.4	Summary for Fisher's exact test for frequency distribution of knowledge for selected demographic variables by weaning methods	110
4.5	Summary for Fisher's exact test for frequency distribution of knowledge for selected demographic variables by categories for basic facts about weaning	111
4.6	Summary for Fisher's exact test for frequencies obtained for selected demographic variables by categories by spontaneous breathing trials	112
4.7	Summary for Fisher's exact test for frequencies obtained for categories of years of ICU experience by selected construct variables	113
4.8	Summary for Fisher's exact test for frequencies obtained for categories of role in ICU by selected construct variables	114

LIST OF FIGURES

4.1	Age distribution of nurse respondents	64
4.2	Distribution of years of working experience in ICU	66
4.3	Distribution of nurse respondents current position in ICU	67
4.4	Frequencies obtained for timing and processing of weaning	71
4.5	Frequencies obtained for long term mechanical ventilation	72
4.6	Frequencies obtained for nurse led weaning	73
4.7	Frequencies obtained for risk of reintubation	74
4.8	Frequencies obtained for complications associated with weaning	75
4.9	Frequencies obtained for use of weaning protocols	77
4.10	Frequencies obtained for failed weaning attempts	78
4.11	Frequencies obtained for reducing ventilator support	79
4.12	Frequencies obtained for least frequently used methods of weaning	80
4.13	Frequencies obtained for notification of extubation	81
4.14	Frequencies obtained for spontaneous breathing trials	82
4.15	Frequencies obtained for respiratory muscle rest	83
4.16	Frequencies obtained for SIMV as a preferred method of weaning	84
4.17	Frequencies obtained for other superior methods of weaning	85
4.18	Frequencies obtained for spontaneous breathing trial	87
4.19	Frequencies obtained for inferior modes to SIMV	88
4.20	Frequencies obtained for multiple ventilator manipulations	90
4.21	Frequencies obtained for other weaning modalities	91
4.22	Frequencies obtained for respiratory muscle fatigue and recovery	92
4.23	Frequencies obtained for multiple daily weaning trials	93
4.24	Frequencies obtained for extubation failure predictions	94
4.25	Frequencies obtained for factors contributing to failure of weaning	95
4.26	Frequencies obtained from nurse respondents for item 29	96
4.27	Frequencies obtained for physiological wellbeing of patients	97
4.28	Frequencies obtained for readiness for weaning	98
4.29	Frequencies obtained for use of respiratory parameters	99

4.30	Frequencies obtained for presence of thick secretions	100
4.31	Frequencies obtained for use of dobutrex with haemodynamic instability	102
4.32	Frequencies obtained for patient's ability to initiate an inspiratory effort	101
4.33	Frequencies obtained for use of rapid shallow breathing index	103
4.34	Frequencies obtained for implementation of weaning protocol	104
4.35	Frequencies obtained for use of sedation agent propofol	105
4.36	Frequencies obtained for reducing patient anxiety	106
4.37	Frequencies obtained for daily interruption of sedation	107

LIST OF ABBREVIATIONS

The following abbreviations are used consistently throughout the study

ICU	Intensive Care Unit
EBP	Evidence based practice
VAP	Ventilator associated pneumonia
VILI	Ventilator induced lung injury
ETT	Endotracheal tube
COPD	Chronic obstructive pulmonary disease
ARDS	Acute respiratory distress syndrome
PEEP	Positive end expiratory pressure
Hb	Haemoglobin
Hct	Haematocrit
NIP	Negative inspiratory pressure
PSV	Pressure support ventilation
T-piece	Thermavent
SBT	Spontaneous breathing trial
SIMV	Synchronised intermittent mandatory ventilation
GCS	Glasgow coma scale
RSBI	Rapid shallow breathing index
CPAP	Continuous positive airway pressure
VADD	Ventilator associated diaphragmatic dysfunction
LTMV	Long term mechanical ventilation
AACCN	American Association Critical Care Nurses
SANC	South African Nursing Council
FiO ₂	Fraction of inspired oxygen
pCO ₂	Partial pressure of carbon dioxide in the blood
PaO ₂	Partial pressure of oxygen in arterial blood
SaO ₂	Arterial oxygen saturation
