

**MOLECULAR CHARACTERIZATION  
OF MULTIDRUG-RESISTANT  
*Salmonella* Isangi IN  
HOSPITALIZED PATIENTS  
IN SOUTH AFRICA**

Tersia Kruger

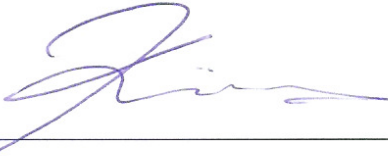

A dissertation submitted to the Faculty of Health Sciences, University of the  
Witwatersrand, Johannesburg, in fulfillment of the requirements for the degree  
Master of Science in Medicine

2007

Johannesburg

## DECLARATION

I, Tersia Kruger, declare that this dissertation is my own work. It is being submitted for the degree of Master of Science in Medicine at the University of the Witwatersrand, Johannesburg. It has not been submitted before for any degree or examination at this or any other University.

## ABSTRACT

Extended-spectrum beta-lactamase (ESBL)-producing *Salmonella enterica* serotype Isangi has emerged as a common *Salmonella* serotype affecting mainly children in hospitals throughout South Africa. Between 2000 and 2002, 279 *S. Isangi* isolates from single infection episodes were referred from 21 hospitals in 5 provinces to the Enteric Diseases Reference Unit of the National Institute for Communicable Diseases of South Africa. All isolates were subjected to antibiotic susceptibility testing and three disk-diffusion methods confirmed ESBL-production in 273 isolates. PCR and nucleotide sequencing of 101 isolates identified TEM-1 (2%), TEM-63 (91%), a novel TEM-131 (7%), and SHV-5 (2%), but CTX-M was not found. Plasmid profiling produced types with 1 to 6 plasmids, 7.4kb to 166kb in size, which were neither serotype nor ESBL-type specific. Pulsed-field gel electrophoresis revealed four major clusters while sub-clusters with identical, or near identical banding patterns suggested extensive intra-hospital transmission and clonal spread between hospitals and provinces in South Africa.

## ACKNOWLEDGEMENTS

All praise to God, who inspired me with will and courage, through the angels of friends and family to believe in myself and have faith and determination; despite the obstacles I had to endure in the last two years.

I would like to gratefully acknowledge my supervisor Professor Hendrik Koornhof for his insight, expert advice, guidance, gentle encouragement, as well as courage to take on this task at a fairly late stage and despite being extremely busy, always made time to engage in interesting discussions. It is an honour. Thank you to my co-supervisor, Dr. Anthony Smith for his technical advice and review of the three molecular chapters and Dr. Karen Keddy for her support during the initiation of this project.

The biggest thanks to my colleagues and friends: Sandrama Nadan, Chantel le Roux, Lorraine Arntzen, Leigh Dini, Dr. Jenny Rossouw, Irma Latsky, Debbie van der Sandt and Dr. Nicola Page for putting up with me. Thank you to Sandrama and Jenny for your technical help and advice. I am indebted to each and every one of you for your understanding, support, endless patience and encouragement when it was most needed.

I am also grateful to the following laboratories and individuals for their contributions:

A very special and huge thank-you to Dr. David Paterson and the staff of the Division of Infectious Diseases at the University of Pittsburgh, with special thanks to my kind and patient friend Dr. Dora Szabó. Thank you for sharing your valuable technical knowledge in a 6-week crash course that enabled me to complete the experimental work in this dissertation;

The Respiratory and Meningeal Pathogens Research Unit (RMPRU) for the sharing of laboratory equipment, especially Dr. Mignon du Plessis for her technical advice;

The Vector Control Reference Unit (VCRU) for welcoming me into their “home” for a while. Thank you for your enthusiasm, support and willingness to help;

The Group for Enteric, Respiratory and Meningeal Disease Surveillance in South Africa (GERMS-SA), the coordinators and all laboratory and hospital staff who contribute to the national and “enhanced” surveillance program in South Africa;

Dr. Nelesh Govender, pathologist for The National Microbiology Surveillance Unit (NMSU) of the NICD, for the updated clinical information on *S. Isangi* in South Africa for 2005;

Greg Duncan-Traill and Tony Chaplin at Davies Diagnostics (PTY Ltd) for providing the ESBL Etests®;

The National Health Laboratory Service (NHLS) for the 3-year grant.

Dr. Linda Meyer from the University of Pretoria for the *E. coli* (CTX-M-14) strain;

To my parents, especially my mother, who has always supported my dreams and aspirations. Thank you for all that you are and all you have done for me.
