DECLARATION

I, Sylvia Vibetti, declare that this research report is my own work. It is being submitted in partial fulfillment for the degree of Master of Arts in Demography and Population Studies at University of the Witwatersrand, Johannesburg. I further declare that neither this report, nor any part of it, has been submitted for any degree or examination in any other university.

DEDICATION

I dedicate this work to my mother Maria Emmarentia Mahlangu Vibetti

For your support emotional and otherwise, and encouragement, I can never thank you enough, and for enduring my absence,

I dedicate this work to you.

ACKNOWLEDGEMENTS

I am grateful to the following people who willingly offered their advice, assistance, encouragement, and support in supervising this research study:

Dr Shireen Ally,
Dr Olumide Taiwo,
Daniel Rakgoasi,
Amos Oyedokun,
&

Senayon Olaoluwa

I thank also my colleagues that lent their support to me. I extend my heartfelt gratitude to my family for their encouragement, support, and most of all their patience.

I acknowledge the will of God in this endeavor.

ABSTRACT

This study aimed to examine the prevalence, correlates and coping strategies of women who have experienced gender-based violence (GBV) in South Africa. Violence in South Africa in general, and violence against women specifically, is an important public health problem with significant consequences for women's development and HIV transmission, among other issues. GBV is not only common and widespread, but also accepted, tolerated, and seen to be normal. Using the 1998 South African Demographic and Health Survey (SADHS), a nationally representative survey of women between the ages of 15-49 years, this study maps out the magnitude of, and factors related to women's experience of violence, and their help seeking behaviour. It examines women's exposure to violence and their coping strategies against their socio-economic and demographic variables. This is facilitated by using the structured questionnaire on the Mistreatment of Women. The analysis is based on a subset of women who had a lifetime experience of violence (1078 observations). Logistic regression is used to estimate the influence of identified predictors on women's experience of violence, and where they seek help after victimization. Just over nine percent (9.2%) of the respondents reported experiencing violence in the 12 months before the survey, and 23.5% sought help after victimization. Age, education, and marital status, were identified as the most important predictors of women's experience of violence. SES was not found to predict where women sought help after victimization. Low use and non-use of services was also found, bringing to question the availability and appropriateness of services provided. This study provides a reliable estimate of the prevalence of physical violence in South Africa that can be used as baseline data for further research in related studies.
