Acknowledgements

The author conducted this research while working on a research project to determine the Stability Mechanisms above Merensky Reef stopes, funded by the Parliamentary Grant programme of the CSIR, South Africa. Research conducted for Anglo Platinum on fall of ground accidents, in the form of consultancy projects, was also included. The support of both these institutions is gratefully acknowledged. I would also like to thank the following individuals and institutions that made this study possible:

My supervisor – Prof. Thomas Stacey and Dr Jan Kuijpers, Dr John Ryder, Dr Dave Roberts, Ms Clare Palmer, Mr Anthony Jager, Dr George Henry, Mr Sarel Coetzer, and Dr Michael Roberts for their valuable advice and encouragement.

Messrs Noel Fernandes, Petr Miovsky, Lucas Van Aswegen, Gavin Potgieter and the rock mechanics and production personnel of the Impala and Anglo platinum mines who provided instrumentation sites and in particular the management of Union Section for cutting an additional pillar for instrumentation purposes.

The management team and other personnel of the CSIR who provided the opportunity for my doctoral studies and helped in the collection of the data.

My wife, Lynne, and children, Bradley and Lerato, for their support and patience during the project.

And, finally, my God, for His continual grace and provision.
