

CHAPTER 4-DESCRIPTION AND LIST OF EXPERIMENTAL SERIES. INVESTIGATIONS OF COMPOSITE ROUGHNESS COEFFICIENT IN A RIVER WITH LOW FLOW

4.1. Experimental Investigation of friction factors and Manning's (n)

Sixteen series of experiments grouped into 2, A and B of eight series each were conducted to obtain the results. The following data was obtained with the help of a 12.1m long and 1m wide flume.

4.2. Group A (Smooth bed flume).

The pictures of the flume in the lab were taken to show the actual experiments conducted. For series 1 the pictures shows the flow in the flume without any elements present in the flume.

Series 1.1

Figure 4.1 Smooth flume without any element except water.

CHAPTER 4-DESCRIPTION AND LIST OF EXPERIMENTAL SERIES. INVESTIGATIONS OF COMPOSITE ROUGHNESS COEFFICIENT IN A RIVER WITH LOW FLOW

The values seen table 4.1 are used to obtain table 4.2. these values in table 4.1 are in millimetres and were converted to metric units in table 4.2. The columns 4-8 are readings of the stilling pot for the respective discharges Q_s in parenthesis. The discharges in the tables are measured in m^3/hr

Table 4.1 Summary of measured depths on the calibrated stilling pots at the given discharge for smooth flume bed.

Column 1 Distances	Column 2 Zeros	Column 3 (100-zeros)	Column 4 D1 (Q=38.5)	Column 5 D2(Q=75.1)	Column 6 D3 (Q=109)	Column 7 D4 (Q=134)	Column8 D5(24)
1.1	61.45	38.55	0.740	20.83	34.54	46.80	-2.260
2.2	61.50	38.50	0.890	21.58	35.10	47.39	-1.500
3.3	60.30	39.70	1.280	21.87	35.50	47.89	-1.030
4.4	59.94	40.06	1.680	22.40	36.05	48.32	-0.490
5.5	59.67	40.33	2.430	23.23	36.98	49.32	0.270
6.6	58.74	41.26	2.830	23.57	37.16	49.68	0.750
7.7	58.00	42.00	3.690	24.31	38.07	50.49	1.800
8.8	57.34	42.66	4.220	25.00	38.64	50.91	1.990
9.9	57.07	42.93	5.130	25.92	39.65	51.91	2.930
11.	55.60	44.40	6.690	26.40	40.25	52.55	3.630

Procedure for table 4.1

Distances in column 1 are the distances of the perforated holes in the bed of the flume from the discharge point (tailgate). The zeros are the readings of the stilling pots when the flume is empty and dry. The 100-zeros column is obtained by subtracting the zeros value from 100.

D1-D5 are the readings of the stilling pots for the corresponding discharges .

It is important to note that the direct readings from the stilling pots in table 4.1 do not give the actual depth of the water in the flume but are invert levels which have to be normalised by applying the procedures listed above

CHAPTER 4-DESCRIPTION AND LIST OF EXPERIMENTAL SERIES. INVESTIGATIONS OF COMPOSITE ROUGHNESS COEFFICIENT IN A RIVER WITH LOW FLOW

The slope of the flume bed was determined by the help of a levelling instrument to be 0.00058. D1-D5 are readings obtained from the stilling pots. These values are selected after a series of adjustment of the tailgate of the flume at a fixed discharge Q by continuous plotting of the readings (I.e. the 10 different readings of D1-D5 in the stilling pots as seen in table 4.1 vs the distances as seen in table 4.1 column 1) of the stilling pot to obtain a slope of the water surface close to the known slope of the flume bed. Adding for instance (D1+zeros value in table 4.1)/1000 = D1e (m) as seen in table 4.2. The term De means effective depth and is averaged to obtain the final effective depth which is in bold as seen in table 4.2.

Table 4.2 Summary of the normalised depth in metres against the stilling pots for smooth flume bed

D1e	D2e	D3e	D4e	D5e
0.062	0.082	0.096	0.108	0.059
0.062	0.083	0.097	0.109	0.060

0.062	0.082	0.096	0.109	0.060
0.062	0.083	0.097	0.109	0.060
0.062	0.082	0.096	0.108	0.059
0.062	0.083	0.096	0.109	0.060

Procedure for table 4.2.

(D1+zeros value in table 4.1)/1000 = D1e.

Similarly D2e-D5e were obtained using the same procedure for obtaining D1e.

The last values in table 4.2 which are bold are the average of the 10 effective depths. The averages are then used to calculate for the f and n in table 4.3

CHAPTER 4-DESCRIPTION AND LIST OF EXPERIMENTAL SERIES. INVESTIGATIONS OF COMPOSITE ROUGHNESS COEFFICIENT IN A RIVER WITH LOW FLOW

The depths seen in table 4.3 were measured and the resistance coefficients, velocities, hydraulic radius and areas were calculated using this measured depths and discharges. These values of (f and n) calculated will be of importance when analysing the data in chapter 5.

Table 4.3 Summary of measured depths, resistance coefficients (f and n) at given discharges for the smooth flume bed.

Q (m ³ /h)	Q(m ³ /s)	Depth(m)	Area (m ²)	V(m/s)	R (m)	(S_f)	f	n

The smooth flume was tested alone with different discharges to establish its resistance characteristics.

Procedures for table 4.3

Discharge was given and depth was determined by trying to obtain uniform flow by adjusting the tail gate. S_f was obtained by plotting a graph of the depth against distance. f was obtained by equation 2.14 and n was obtained by equation 2.15. Area (m) was obtained by multiplying the depth by the width of the channel which is 1m. Velocity was obtained by dividing the discharge by the area. Hydraulic radius R (m) was obtained by dividing the area by perimeter of the flume (I.e. $1+2*\text{effective depth}$)

CHAPTER 4-DESCRIPTION AND LIST OF EXPERIMENTAL SERIES. INVESTIGATIONS OF COMPOSITE ROUGHNESS COEFFICIENT IN A RIVER WITH LOW FLOW

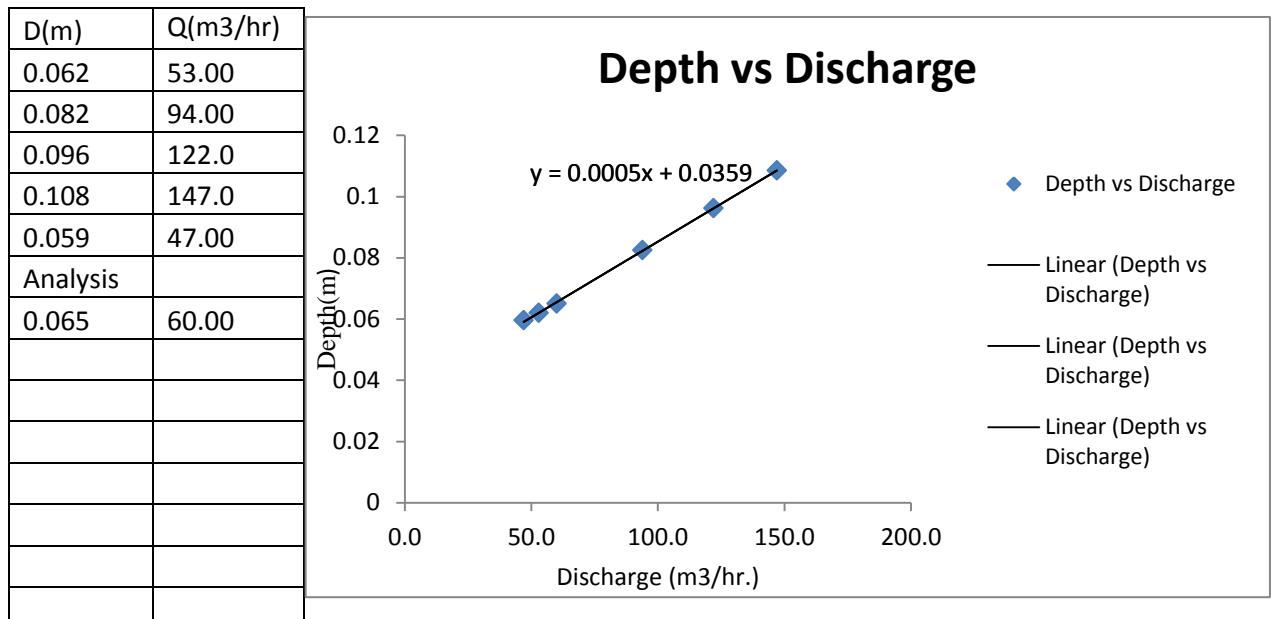

Figure 4.2 Stage-discharge graph for smooth bed flume.

Figure 4.2 above is the stage-discharge graph which is used for interpolating for other depths given discharge or other discharges given depths.

The remaining series listed below are found in the appendix and were obtained in a way similar to series 1.1.

4.3 Group B (Rough bed flume)

The rough bed flume is similar to the smooth bed flume except that the bed of the flume was lined with 19mm gravel stones. As seen in figures 3.4.1 to 3.4.8 in chapter 3

4.4 List of experimental series

The experiments carried out in the flume were labelled as series as seen in section 4.1 i.e. series 1.1 to 1.8 for the smooth bed flume and 2.1 to 2.8 for the rough bed flume. Each series contains a detailed explanation as seen in section 4.2 above of the pictures, graphs and tables

**CHAPTER 4-DESCRIPTION AND LIST OF EXPERIMENTAL SERIES.
