

**THE ORIGIN OF SLOPE DEPOSITS IN THE
SOUTHERN DRAKENSBERG, EASTERN
LESOTHO**

Stephanie Christiane Mills

Submitted in fulfilment of the academic requirements for the degree of
Doctor of Philosophy

School of Geography, Archaeology and Environmental Studies
University of the Witwatersrand, Johannesburg

Johannesburg
July 2006

This thesis is dedicated to the memory of my father, Ken Mills (1946-2004).

Declaration

I declare that this thesis is my own, unaided work, except where otherwise acknowledged. It is being submitted for the degree of PhD to the University of the Witwatersrand, Johannesburg. It has not been submitted before for any degree or examination in any other university.

A handwritten signature in black ink, appearing to read 'S. Mills', is positioned above a horizontal line.

14th day of July 2006

Abstract

The high Drakensberg of southern Africa has received considerable geomorphological interest during recent decades. In particular, there has been an ongoing debate concerning the accuracy of landform interpretations which propagate past glaciation and permafrost. This research examines the macro and micro-sedimentology of various deposits found in eastern Lesotho and compares them with possible geomorphological process origins such as debris flows, debris avalanches, mudflows, mudslides, landslides, solifluction deposits, rock glaciers, pronival ramparts, glacial moraines and fluvial deposits. The results support the contention that four of the deposits are moraines, formed by small glaciers, and one is a debris flow which was initiated by a small glacier. However, two further deposits indicate that localities in close proximity to the linear deposits experienced mass wasting, associated with past periglacial conditions. With the assistance of applying glacier reconstruction methods, modelling hillshade, the provision of new palaeoclimatic extrapolations, and correlation of deposits with contemporary snow patch distribution, it is demonstrated that the valley slope deposits are determined by a past climate that was within the glacial/periglacial equilibrium zone, and was influenced by specific topographic and associated micro-climatic thresholds. It is shown that macro-topographic factors (e.g. slope gradient, aspect etc) and summit altitude are critical factors determining whether slopes were influenced by periglacial (mass wasting) or glacial processes (small niche/cirque glaciers) in adjacent valleys.

Preface

This work stems from the discovery of debris deposits in eastern Lesotho, which display unique morphological characteristics. No work has previously been undertaken on such deposits in the area, which thus offers a great opportunity to add understanding to the Quaternary history of southern Africa. Having lived and been educated all my life in the northern hemisphere, I was unaware of the controversial debate regarding the Quaternary history of southern Africa. This has helped offer a fresh perspective, without any preconceived ideas as to the processes which formed these deposits. The process origins considered for the formation of these deposits were chosen based on the morphology of such process origins and their role in the alpine environment. The initial aim of this research was to ascertain which processes could have formed the deposits located in eastern Lesotho, however through the use of sedimentological analysis and AMS dating, it soon became clear that a serious contender was that of past glacial processes. Given the controversy surrounding such a claim, it was necessary to investigate this further through the use of glacier reconstruction techniques and the influence of solar radiation. These techniques helped further reinforce that small glaciers had been present in the past, however the lack of further deposits on adjacent slopes indicates that glaciers were restricted to only a few areas. Given the recent prolific production of periglacial-related literature for Lesotho, it is hoped that this research will reawaken the interest into past glacial processes, which were first suggested five decades ago.

Sections of this work have been presented at the *SASQUA* conference in Johannesburg, South Africa in 2003, the *Sixth International Conference on Geomorphology* in Zaragoza, Spain in 2005 and the *Geomorphology and Earth System Science* (BGRG) conference in Loughborough, England in 2006. Sections of this work have also been published in *Quaternary International*, 2005.

Acknowledgements

There are many people who have provided assistance with this research project and they are thanked in no particular order. I would first like to thank Colin Bones, without whom I would never have discovered the wonderful country that is South Africa. Colin has supported me both personally and financially and was also indispensable when it came to field work. Although he swore he would never go back to Lesotho and undertake another minute of fieldwork after his first experience, he returned time and time again, and put up with endless hours of horse riding, digging and carrying very heavy soil samples. He has also proved invaluable in terms of proof reading and checking references and has had to put up with my incessant work during the last few months of this research.

Several people have helped me with fieldwork and made the time more enjoyable. Thank you very much Christine Deschamps and Joel LeBaron for your tireless help in the field, friendship and advice throughout. They put up with 12 hours on a horse to get to one of my sites, which was not a particularly enjoyable experience and days camping in the freezing cold, so thanks guys. Thank you also to Nicolas Mulder and Emily Craven for their help in the field on separate occasions. Thank you also to Nicolas for providing the contemporary snow patch distribution diagrams which were used in this research.

Many people have also provided their time, energy and expertise to help me in the laboratory. Thanks to Thandiswe Nsimbi for his help in enabling me to have access to the soils lab and in helping me whenever the sieving machine broke down. Due to the lack of equipment at Wits I contacted my old university (Royal Holloway University of London) in order to beg them to let me have the use of their soils lab. Huge thanks to Adrian Palmer for helping me with the sedigraph machine and the manufacturing of the thin sections. Adrian dedicated a lot of his time in supervising me during the manufacturing process and also allowed me the use of microscopes during endless hours and days of analysis. Adrian proved indispensable, when on moving back to the UK the thin sections along with my hand luggage were stolen. Thanks to the insurance pay out he was able to re-do all my thin sections when I just didn't have the time nor the courage. Many thanks to Stefan Woodborne and staff at the QUADRU,

CSIR for discussions and providing the AMS dates. Thank you also to Devlyn Hardwick for her advice regarding the DEM and to Eric Hallot for creating it. Statistical analysis would have been much more difficult had it not been for Richard Smerin's help, which was much appreciated.

Scientific advice on the various aspects of my thesis has been provided by several people. I would first like to thank Simon Carr for all his help and advice regarding the glacier reconstruction work. Simon gave up his time to take me through the process step by step, along with his postgraduate student, Chris Coleman. Thanks also for checking that I had undertaken the process correctly and also on the advice regarding several aspects of my PhD. Thanks also to Jim Rose for all his advice regarding the Sehonghong deposits. Jaap Van der Meer gave up time for discussion and looked through my thin sections and advised me on references I should look at. Correspondence by email was also invaluable and I would like to thank Colin Thorn for his advice regarding snow patches, Richard Shakesby for his advice regarding pronival ramparts, Wishart Mitchell for his advice regarding snow blow and Pascal Bertran and John Menzies for their advice on the micromorphology of debris flows. Thank you also to Colin Lewis for his advice regarding the Sehonghong deposits and Richard Washington for his advice regarding past climatic processes.

Many people have helped towards the end of this research so I would like to apologise to my friends for roping them into this, but at least they have a better understanding of what I have been doing for the last few years. Thank you to Naomi Davies for checking my references and to Deana Rouse and Helen Cameron for proof reading a few chapters. Thank you also to Claire Munson for proof reading some chapters and for all her support and friendship over the years. I would also like to thank my family for their moral support and for coming out to visit so many times in South Africa so that it didn't seem we were too far away from home. Thanks to my dad as I'm sure it was his passion for geography that first awakened mine. I'm just sorry that he wasn't able to see me complete this PhD but his support in the beginning was instrumental.

Finally, but by no means least I would like to thank my supervisor, Stefan Grab. Thank you for providing the funding for the AMS dates, without which this thesis would have had much less of a standing in stating that glaciers existed during the Last

Glacial Maximum (LGM). Stefan believed in me and encouraged me throughout and was the inspiration behind this project. Thank you for going through my thesis with a fine tooth comb, for putting me in touch with others, suggesting various references I should read and for developing my writing skills into what they are now. Thank you also for encouraging me to present my work at various conferences and for all your help with the article that we published.

6.8	Grain size distributions for the sediment from trench 3, Sekhokong Site 1	173
6.9	Clast orientation, dip and contouring at trenches 1, 2 and 3 at Sekhokong Site 1	177
6.10	Till fabric using eigenvalue data for the Sekhokong Site 1 deposit	178
6.11	Triangular plot of normalised eigenvalues for the Sekhokong Site 1 deposit	179
6.12	Triangular diagrams for clasts in trenches 1, 2 and 3 respectively at Sekhokong Site 1	180
6.13	Isolines of the Oblate-prolate index for trenches 1, 2 and 3 respectively at Sekhokong Site 1	181
6.14	Isolines of the maximum projection sphericity for trenches 1, 2 and 3 respectively at Sekhokong Site 1	183
6.15	Graphs representing visual roundness of clasts in trenches 1 (A), 2 (B) and 3 (C) at Sekhokong Site 1	184
6.16	An example of plane voids in trench 3 at 125 cm depth taken in XPL	187
6.17	Single crystals within groundmass at Sekhokong Site 1, trench 3, taken in XPL	188
6.18	Rotation structures within trench 3 at 125 cm depth	189
6.19	The Sekhokong Site 2 slope deposit	192
6.20	Morphological map of the Sekhokong Site 2 deposit	193
6.21	Sedimentological and stratigraphical data for trench 1 at Sekhokong Site 2	194
6.22	Sedimentological and stratigraphical data for trench 2 at Sekhokong Site 2	194
6.23	Sedimentological and stratigraphical data for trench 3 at Sekhokong Site 2	195
6.24	Grain size distributions for the sediment from trench 1, Sekhokong Site 2	197
6.25	Grain size distributions for the sediment from trench 2, Sekhokong Site 2	198
6.26	Grain size distributions for the sediment from trench 2, Sekhokong Site 2	199
6.27	Clast orientation, dip and contouring at trenches 1, 2 and 3 at Sekhokong Site 2	202
6.28	Till fabric using eigenvalue data for the Sekhokong Site 2 deposit	203

6.29	Triangular plot of normalised eigenvalues for the Sekhokong Site 2 deposit	204
6.30	Triangular diagrams for clasts in trenches 1, 2 and 3 respectively at Sekhokong Site 2	205
6.31	Isolines of the Oblate-prolate index for trenches 1, 2 and 3 respectively at Sekhokong Site 2	206
6.32	Isolines of the maximum projection sphericity for trenches 1, 2 and 3 respectively at Sekhokong Site 2	208
6.33	Graphs representing visual roundness of clasts in trenches 1 (A), 2 (B) and 3 (C) at Sekhokong Site 2	209
6.34	Coarse material with very little fine fractions taken in PPL in trench 3 at 150 cm depth	212
7.1	The Leqooa Valley western slope deposit	216
7.2	The Leqooa Valley eastern slope deposit	216
7.3	Morphological map of the Leqooa Valley deposits	217
7.4	Sedimentological and stratigraphical data for trench 1 of the western slope deposit, Leqooa Valley	219
7.5	Sedimentological and stratigraphical data for trench 2 of the western slope deposit, Leqooa Valley	219
7.6	Sedimentological and stratigraphical data for trench 3 of the western slope deposit, Leqooa Valley	220
7.7	Sedimentological and stratigraphical data for trench 1 of the eastern slope deposit, Leqooa Valley	221
7.8	Sedimentological and stratigraphical data for trench 2 of the eastern slope deposit, Leqooa Valley	221
7.9	Sedimentological and stratigraphical data for trench 3 of the eastern slope deposit, Leqooa Valley	222
7.10	Grain size distributions for the sediment from the trench 1 of the western slope deposit	223
7.11	Grain size distributions for the sediment from the trench 2 of the western slope deposit	224
7.12	Grain size distributions for the sediment from the trench 3 of the western slope deposit	225
7.13	Grain size distributions for the sediment from the trench 1 of the eastern slope deposit	229
7.14	Grain size distributions for the sediment from the trench 2 of the eastern slope deposit	230
7.15	Grain size distributions for the sediment from the trench 3 of the eastern slope deposit	231
7.16	Clast orientation, dip and contouring at trenches 1, 2 and 3 at the western slope deposit, Leqooa Valley	235
7.17	Till fabric using eigenvalue data for the western slope deposit	236
7.18	Triangular plot of normalised eigenvalues for the western slope deposit	237
7.19	Clast orientation, dip and contouring at trenches 1, 2 and 3 at the eastern slope deposit, Leqooa valley	238
7.20	Till fabric using eigenvalue data for the eastern slope deposit	240
7.21	Triangular plot of normalised eigenvalues for the eastern slope deposit	241
7.22	Triangular diagrams for clasts in trenches 1, 2 and 3 respectively at the western slope deposit	242

7.23	Isolines of the Oblate-prolate index for trenches 1, 2 and 3 respectively at the western slope deposit	243
7.24	Isolines of the maximum projection sphericity for trenches 1, 2 and 3 respectively at the western slope deposit	244
7.25	Graphs representing visual roundness of clasts in trenches 1 (A), 2 (B) and 3 (C) at the western slope deposit	245
7.26	Triangular diagrams for clasts in trenches 1, 2 and 3 respectively at the eastern slope deposit	248
7.27	Isolines of the Oblate-prolate index for trenches 1, 2 and 3 respectively at the eastern slope deposit	249
7.28	Isolines of the maximum projection sphericity for trenches 1, 2 and 3 respectively at the eastern slope deposit	250
7.29	Graphs representing visual roundness of clasts in trenches 1 (A), 2 (B) and 3 (C) at the eastern slope deposit	251
7.30	Clay capping on clast in trench 2 taken in XPL	255
7.31	Examples of rotational structures about clasts	256
7.32	Silt cappings and coarse material within trench 3 taken in PPL	258
8.1	The colluvial deposits along the south-facing slopes of the Sehonghong River	262
8.2	Morphological map of the Sehonghong River Valley deposits	264
8.3	Site 1 along the Sehonghong River	265
8.4	Site 2 along the Sehonghong River	265
8.5	Site 3 along the Sehonghong River	266
8.6	Sedimentological and stratigraphical data for Site 1 along the Sehonghong River	267
8.7	Sedimentological and stratigraphical data for Site 2 along the Sehonghong River	268
8.8	Sedimentological and stratigraphical data for Site 3 along the Sehonghong River	269
8.9	Grain size distributions for the sediment from Site 1 along the Sehonghong River	271
8.10	Grain size distributions for the sediment from Site 2 along the Sehonghong River	272
8.11	Grain size distributions for the sediment from Site 3 along the Sehonghong River	273
8.12	Clast orientation, dip and contouring at Sites 1, 2 and 3 at Sehonghong	277
8.13	Till fabric using eigenvalue data for the Sehonghong River deposits	278
8.14	Triangular plot of normalised eigenvalues for the Sehonghong River deposits	279
8.15	Triangular diagrams for Trenches 1, 2 and 3 respectively at Sehonghong	280
8.16	Isolines of the Oblate-prolate index for Sites 1, 2 and 3 respectively at Sehonghong	281
8.17	Isolines of the maximum projection sphericity for Sites 1, 2 and 3 respectively at Sehonghong	283
8.18	Graphs representing visual roundness of clasts (after Powers, 1953) at Site 1 (A), 2 (B) and 3 (C) at Sehonghong	284
8.19	Silt capping encircling basal grain taken in PPL at Sehonghong Site 1	289
8.20	Clay coatings at Sehonghong Site 2 taken in XPL	289
8.21	Clay coatings at Sehonghong Site 2 taken in XPL	290
8.22	The site stratigraphy and Radiocarbon dates for the exposure at Site 3	290

8.23	Mean monthly temperatures for Nhlangeni for the period 2000 to 2002	292
9.1	A plan view and a longitudinal cross section of the Sekhokong Site 2 deposit showing waves	296
9.2	Debris deposits in the Drakensberg at Njesuthi	296
9.3	Solifluction lobes on the Drakensberg	299
9.4	An example of where a potential terrace has been separated by tributary entrenchment on the south-facing slope at Sehonghong	303
9.5	Typical grain size distributions for supraglacial debris compared to an example at Tsatsa-La-Mangaung	324
9.6	Co-variance plot of C_{40} and RA indexes and sediment envelopes in comparison to the three trenches at the Tsatsa-La-Mangaung deposit	324
9.7	The grain-size distribution of subglacially transported debris, composed of three distinct populations compared to an example at Sekhokong Site 1	327
9.8	Co-variance plot of C_{40} and RA indexes and sediment envelopes in comparison to the three trenches at the Sekhokong Site 1 deposit	328
9.9	Co-variance plot of C_{40} and RA indexes and sediment envelopes in comparison to the three trenches at the Leqooa Valley deposits	335
9.10	Grain-size curves for Sekhokong Site 1 and 2 compared to Beskow's (1935) frost susceptibility criteria	338
9.11	Ternary plot of sand-silt-clay for the matrix component of the Sehonghong Site 1 and 2 deposit compared to the textural envelope for active solifluction	342
9.12	Ternary plot of sand-silt-clay for the matrix component of the Sehonghong Site 3 deposit compared to the textural envelope for active solifluction	344
9.13	A view of the Sehonghong Site 3	346
10.1	A 20 year temperature record for Shaleburn	353
10.2	A 25 year precipitation record for Himeville	356
10.3	Plotting of the high Drakensberg LGM palaeoclimates for the Tsatsa-La-Mangaung, Sekhokong and Leqooa Valley sites, with the best-fit climate curve for the ELA of 70 glaciers	357
10.4	Plotting of the high Drakensberg LGM palaeoclimates for the Nhlangeni south-facing slope, with the best-fit climate curve for the ELA of 70 glaciers	359
10.5	Plotting of the high Drakensberg LGM palaeoclimates for the Nhlangeni north-facing slope, with the best-fit climate curve for the ELA of 70 glaciers	360
10.6	The reconstructed three-dimensional form of the possible palaeoglacier at Tsatsa-La-Mangaung	362
10.7	The reconstructed three-dimensional form of the possible palaeoglacier at Sekhokong Site 1	363
10.8	The reconstructed three-dimensional form of the possible palaeoglacier at Sekhokong Site 2	363
10.9	The reconstructed three-dimensional form of the possible palaeoglacier at Leqooa Valley	364
10.10	Surface wind roses for Sani Top	369
10.11	Schematic drawing showing the Drainage area (D) above the temperature-precipitation-wind equilibrium-line altitude (TPW-ELA) and the corresponding Accumulation zone (A) of a cirque Glacier	370
10.12	Potential snowblow areas for each former glacier	371

10.13	Polar plots of snowblow area and orientation for each Palaeoglacier	372
10.14	Mean monthly solar radiation on a north and south-facing slope at Nhlangei	377
10.15	Solar radiation for the north and south-facing slope at Nhlangei for various times of day	379
10.16	An example of afternoon cloud cover, covering Kibo on a south-western facing slope at 3950 m a.s.l	382
10.17	Map indicating areas of shade at different times of the day and year at Tsatsa-La-Mangaung	384
10.18	Map indicating areas of shade at different times of the day and year at Sekhokong Site 1	385
10.19	Map indicating areas of shade at different times of the day and year at Sekhokong Site 2	386
10.20	Map indicating areas of shade at different times of the day and year at Leqooa Valley	387
10.21	Map indicating areas of shade at different times of the day and year at Sehonghong	389
10.22	A comparison of direct sunlight reaching slopes at Leqooa Valley during the winter solstice	390
10.23	A real life colour composite image for the 3 rd August 1990	391
10.24	A real life colour composite image for the 19 th August 1990	392
10.25	DEM of the position of the palaeoglaciers in relation to each other	395
11.1	Linear deposits identified from areas of late-lying snow cover in the Drakensberg	401

List of Tables

2.1	A review of the literature for southern African high mountain environments, for each process mechanism presented in this research	13
2.2	Classification and characteristics of the major types of mass movement	15
2.3	Summary of clast-fabric data for specific landforms	18
2.4	Summary of the characteristics of particle shape for the various process origins	19
2.5	Typical depth/length (D/L) ratios and limiting (threshold) slope inclinations for landslides in soils	24
2.6	Summary of the main sedimentary characteristics of the main types of till	51
2.7	Criteria for the identification of gravity flow till	52
2.8	Suggested 'diagnostic' criteria indicating a pronival rampart rather than a moraine origin	60
2.9	The different glaciations for Mount Kenya	72
2.10	A summary of the timing of the LGM around the southern Hemisphere	82
3.1	Average composition of Lesotho Formation Basalt	87
3.2	The climatic reconstruction for southern Africa with time	101
4.1	Qualitative scheme for induration (hardness)	109
4.2	List of maximum permissible sieving loadings	115
4.3	Phi-unit to millimetre/micrometer conversion table	116
4.4	Effect of latitude and season on the fortnightly mean day length	130
5.1	Particle size statistical values for the Tsatsa-La-Mangaung slope deposit	143
5.2	Further particle size statistical values for the Tsatsa-La-Mangaung slope deposit	144
5.3	Verbal scale for standard deviation (sorting), Skewness and Kurtosis	145
5.4	Mean and standard deviation for the particle size statistical analysis at the Tsatsa-La-Mangaung slope deposit	145
5.5	Particle size statistical values for the Tsatsa-La-Mangaung pits	148
5.6	Further particle size statistical values for the Tsatsa-La-Mangaung pits	149
5.7	The percentage of clasts falling within the various shape categories at Tsatsa-La-Mangaung	154
5.8	The shape of clasts measured at the Tsatsa-La-Mangaung slope deposit	155
5.9	The percentage of clasts falling in the roundness categories at Tsatsa-La-Mangaung	157
5.10	The statistical significance calculated by the t-test of the shape of clasts sampled in the three trenches in the Tsatsa-La-Mangaung deposit	158
5.11	Micromorphological description of the Tsatsa-La-Mangaung samples	159
5.12	AMS and calibrated ages for the Tsatsa-La-Mangaung deposit	164
5.13	A summary of the sedimentary characteristics at Tsatsa-La-Mangaung	164
6.1	Particle size statistical analysis for the Sekhokong Site 1 deposit	174
6.2	Further particle size statistical values for Sekhokong Site 1	175
6.3	Mean and standard deviation for the particle size statistical analysis at Sekhokong Site 1	176
6.4	The percentage of clasts falling within the various shape categories at Sekhokong Site 1	180

6.5	The shape of clasts measured at the Sekhokong Site 1 slope deposit	182
6.6	The percentage of clasts falling in the roundness categories at Sekhokong Site 1	184
6.7	The statistical significance calculated by the t-test of the shape of clasts sampled in the three trenches in the Sekhokong Site 1 deposit	185
6.8	The statistical significance calculated by the t-test of the shape of clasts sampled in the three trenches in the Tsatsa-La-Mangaung and Sekhokong Site 1 deposits	185
6.9	Micromorphological description of the Sekhokong Site 1 samples	186
6.10	AMS and calibrated ages for the Sekhokong Site 1 deposit	190
6.11	A summary of the sedimentary characteristics at Sekhokong Site 1	190
6.12	Particle size statistical analysis for Sekhokong Site 2	200
6.13	Further particle size statistical values for Sekhokong Site 2	201
6.14	Mean and standard deviation for the particle size statistical analysis at Sekhokong Site 2	201
6.15	The percentage of clasts falling within the various shape categories at Sekhokong Site 2	205
6.16	The shape of clasts measured at the Sekhokong Site 2 slope deposit	208
6.17	The percentage of clasts falling in the roundness categories at Sekhokong Site 2	209
6.18	The statistical significance calculated by the t-test of the shape of clasts sampled in the three trenches in the Sekhokong Site 2 deposit	209
6.19	The statistical significance calculated by the t-test of the shape of clasts sampled in the three trenches in the Tsatsa-La-Mangaung and Sekhokong Site 1 deposits	210
6.20	Micromorphological description of the Sekhokong Site 2 samples	211
6.21	AMS and calibrated ages for the Sekhokong Site 2 deposit	213
6.22	A summary of the sedimentary characteristics at Sekhokong Site 2	213
7.1	Particle size statistical analysis for western slope deposit	226
7.2	Further particle size statistical analysis for the western slope deposit	228
7.3	Mean and Standard deviation for the particle size statistical analysis for the western slope deposit	228
7.4	Particle size statistical analysis for the eastern slope deposit	232
7.5	Further particle size statistical analysis for the eastern slope deposit	233
7.6	Mean and Standard deviation for the particle size statistical analysis of the eastern slope deposit	233
7.7	The percentage of clasts falling within the various shape categories for the western slope deposit	242
7.8	The shape of clasts measured at the Leqooa western slope deposit	243
7.9	The percentage of clasts falling in the roundness categories at the western slope deposit	245
7.10	The statistical significance calculated by the t-test of the shape of clasts sampled in the three trenches in the western slope deposit	246
7.11	The statistical significance calculated by the t-test of the shape of clasts sampled in the three trenches for the western slope deposit, Tsatsa-La-Mangaung and Sekhokong Sites 1 and 2 deposits	246
7.12	The percentage of clasts falling within the various shape categories for the eastern slope deposit	248
7.13	The shape of clasts measured at the Leqooa eastern slope deposit	249

7.14	The percentage of clasts falling in the roundness categories at the eastern slope deposit	251
7.15	The statistical significance calculated by the t-test of the shape of clasts sampled in the three trenches	252
7.16	The statistical significance calculated by the t-test of the shape of clasts sampled in the three trenches for the eastern slope deposit, western slope deposit, Tsatsa-La-Mangaung and Sekhokong Sites 1 and 2 deposits in the eastern slope deposit	253
7.17	Micromorphological description of the Leqooa western deposit samples	254
7.18	Micromorphological description of the Leqooa eastern deposit samples	257
7.19	AMS and calibrated ages for the Leqooa Valley deposits	260
7.20	A summary of the sedimentary characteristics at the Leqooa western deposit	260
7.21	A summary of the sedimentary characteristics at the Leqooa eastern deposit	261
8.1	Particle size statistical values for the Sehonghong River deposits	274
8.2	Further particle size statistical values for the Sehonghong River deposits	275
8.3	Mean and Standard deviation for the particle size statistical analysis at the Sehonghong River deposits	275
8.4	The percentage of clasts falling within the various shape categories at the Sehonghong Site	282
8.5	The shape of clasts measured at Sehonghong	283
8.6	The percentage of clasts falling in the roundness categories at Sehonghong	284
8.7	The statistical significance calculated by the t-test of the shape of clasts sampled at the three Sehonghong Sites	285
8.8	The statistical significance calculated by the t-test of the shape of clasts sampled at the three sites at Sehonghong, compared to those for the Tsatsa-La-Mangaung, Sekhokong Sites 1 and 2 and Leqooa western and eastern deposits	286
8.9	Micromorphological description of the Sehonghong samples	287
8.10	Radiocarbon dates for Sehonghong Site 3 deposit	291
8.11	Mean annual air temperatures at Nhlangeni during the period 2000 to 2002	293
8.12	A summary of the sedimentary characteristics at Sehonghong	294
9.1	Suitability of geomorphic processes and landform types for the various Tsatsa-La-Mangaung deposit attributes	321
9.2	Suitability of geomorphic processes and landform types for the various Sekhokong Site 1 deposit attributes	326
9.3	Suitability of geomorphic processes and landform types for the various Sekhokong Site 2 deposit attributes	330
9.4	Suitability of geomorphic processes and landform types for the various Leqooa western deposit attributes	333
9.5	Suitability of geomorphic processes and landform types for the various Leqooa eastern deposit attributes	333
9.6	Suitability of geomorphic processes and landform types for the various Sehonghong Sites 1 and 2 south-facing deposit attributes	337

9.7	Suitability of geomorphic processes and landform types for the Sehonghong Site 3 upper unit north-facing deposit attributes	343
9.8	Suitability of geomorphic processes and landform types for the Sehonghong Site 3 lower unit north-facing deposit attributes	343
9.9	A summary table of the radiocarbon and calibrated ages for the study sites	348
10.1	Summer temperature data for Sani Top	352
10.2	Summer temperature data for Nhlangeni south-facing slope	354
10.3	Summer temperature data for Nhlangeni north-facing slope	354
10.4	Ablation for each contour interval at Tsatsa-La-Mangaung, Sekhokong Sites 1 and 2 and Leqooa Valley	365
10.5	Derived mass-balance characteristics at the four sites investigated	366
10.6	Values of potential snowblow for each 90° sector	374
10.7	D/A ratios for the four sites	374
10.8	Mean monthly solar radiation values for a north and south-facing slope at Nhlangeni	378
10.9	Solar radiation values for a north-facing slope at Nhlangeni at various times of the day	380
10.10	Solar radiation values for south-facing slope at Nhlangeni at various times of the day	380
11.1	A Summary of similar ELAs to those observed for the Drakensberg in East Africa and the southern hemisphere	399
