

3. RESEARCH METHODOLOGY

3.1 Investigative approach

This thesis used the following definitions for the key terms identified during the literature review:

1. Supply chain: *The linkage of strategic, tactical and operational activities dealing with the flow of goods, information and services from the supplier's supplier to the customer's customer.*
2. Supply chain goal: *To gain sustainable competitive advantage for an organisation.*
3. FMCG: *High velocity and agile industry focused on producing and selling branded goods consumed daily by consumers.*
4. Supply chain performance attributes and metrics: *As defined by SCC (2008).*
5. Standard income statement and balance sheet elements: *As defined by Needles, Powers & Crosson (2008).*
6. Transnational supply chains: *Supply chain operations beyond the geographic boundaries of a country.*

This research study used the following investigative approach, based on the research framework (discussed in section 1.7), as shown in figure 3-1.

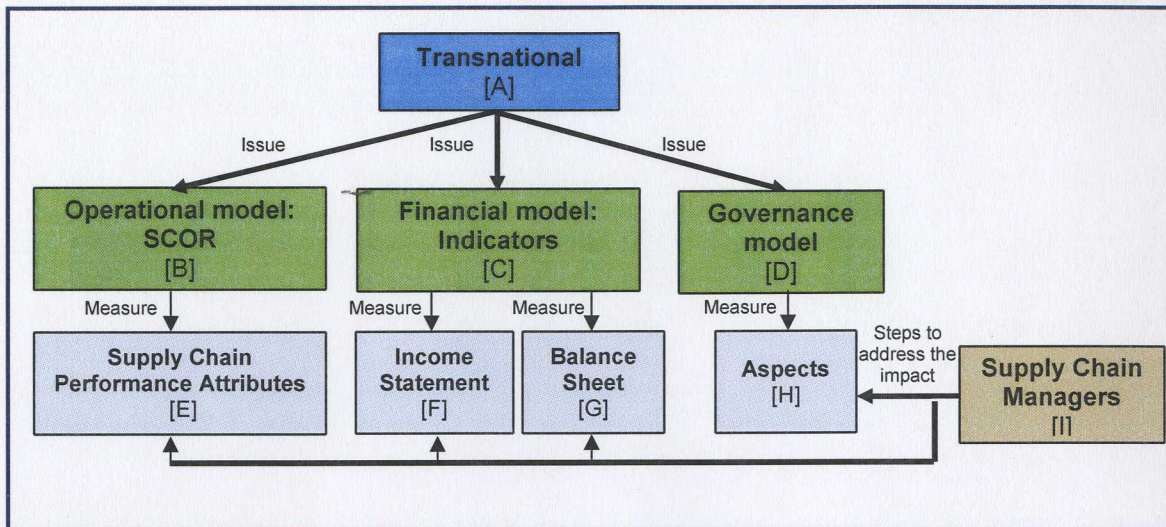

Figure 3-1: Investigative approach

The introduction of transnational elements [A] created an issue within supply chains. The issue was identified in terms of the SCOR model [B], the financial indicators [C] and the governance model [D]. The supply chain performance attributes [E] represented the SCOR model [B]. The income statement [F] and the balance sheet [G] represented the financial indicators [C]. Various supply chain aspects [H] represented the governance model [D]. The steps [I] that supply chain managers were taking to address the issues raised by the transnational elements in FMCG supply chains were identified with respect to the supply chain performance attributes [E], the income statement [G], the balance sheet [F] and the supply chain aspects [H].

3.2 Methodology

This research study used a qualitative approach to data collection. The decision to use this approach was based on the fact that it was useful for obtaining information from a real environment where the researcher had to interact with the respondents in their natural environment (Denzin & Lincoln, 2000) and where the data was not available at one place in its explicit form (Goddard & Melville, 2007). This research study also collected quantitative data to validate the findings that were obtained from the qualitative approach (Creswell, 2009). However, the primary focus was the qualitative approach.

Gillham (2000) and Merriam (2009) stated that a qualitative study was descriptive in nature. As mentioned earlier, Pirow (1994), Knobel & Lankshear (1999) and Creswell (2009) also referred to qualitative research as field research where data collection tools focused on interfacing with respondents. According to Gillham (2000:10), such methods focused on “the kind of evidence ‘what people tell you, what they do’ that will enable the researcher to understand the meaning of what is going on”.

Based on the definitions given by Knobel & Lankshear (1999), Gillham (2000), Denscombe (2003), Yin (2003), Stacey & Whittaker (2005) and Yin (ed.) (2009) the case study research methodology was a detailed, descriptive and construal study that centred on real life contexts and relied on multiple sources of data collection.

This research study was therefore essentially a qualitative case study using data collection methods such as interviews and the study of documents, since this type of approach was most suited to answering the questions that it proposed.

This research study, in essence, used the collective case study approach. Denscombe (2003) stated that the use of multiple cases (as was done in this thesis) enabled within-case and across-case approaches to data analysis, comparison and the interpretation of findings.

Multiple sources of evidence such as industry reports, business reports, interviews, newspaper articles, internal project documents and the minutes of meetings were used in this research study. Gillham (2000:1) highlighted “the need to collect different kinds of evidence, to make the study valid and to provide the best answers to one’s research questions”.

3.3 Instrument

This research study used Leedy & Ormrod's (2005) approach for data collection, analysis and reporting. The collective case study approach was used to gain in-depth knowledge of the selected FMCG organisations from India and South Africa in order to compare their typology and to identify and compare the issues they faced and the steps taken to deal with these issues by FMCG supply chains in these two countries.

The study design for this research was based on multiple point contacts (Cooper & Schindler, 2008) with each of the four cases. The design focused on collecting information from face-to-face interviews and document analysis such as internal project reports, minutes of meetings, newspaper articles and business reports. Individual face-to-face interviews were conducted based on a questionnaire protocol designed to address the areas of the investigative approach and also to allow respondents to freely speak about their thoughts and share their information and insights. The interviews used in this study were characterised as being "semi-structured"⁷² because they were open ended or flexible (Yin (ed.), 2009).

Some quantitative data was also collected from the documents provided by the cases, either to obtain further information related to particular issues or to validate issues or the steps taken to deal with such issues.

⁷² It referred to obtaining answers to the questions in an order merely natural to the flow of conversation. The interviewee, on the other hand, had the freedom to say whatever comes to mind.

3.4 Cases

Supervisors and the first readers of the thesis proposal advised the researcher to limit the number of case studies in order to ensure that the scope of this thesis would remain within manageable limits. It was felt that a set of case studies from each of the product segments from each country would provide a comprehensive investigation of the issues facing transnational supply chain managers and the steps taken to deal with them.

A comparative set of cases were chosen based on the following criteria:

- a) representation of either of the product segments and similar products
- b) origin in either of the two countries
- c) access to information.

Based on the first two criteria, a set of four organisations from each country was identified. This was further filtered down by the third criterion to only two organisations from each country in order to allow the researcher to conduct in-depth research and analysis. The researcher selected a set of four case studies, and one case study from each of the personal care and packaged food product segments was taken from each country. The cases are shown in table 3-1.

Product segment/ Country	Personal care	Packaged food
India	Dabur India (Pty) Limited (Dabur)	Surya Foods (Pty) Limited (Surya)
South Africa	Amka Products (Pty) Limited (Amka)	Anglo Vaal Industries Limited (AVI)

Table 3-1: Setup of case studies

3.5 Data collection

Data requirements were guided by the objective of this thesis and the corresponding investigative approach. This research study used a protocol based on the investigative approach with an open- and close-ended questionnaire to obtain the primary data through face-to-face interviews with respondents. In certain cases, audio recordings were also made of the face-to-face interviews to allow the researcher to refer to the content again at a later stage, if necessary. Secondary data was obtained from published business and financial reports, internal project reports, minutes of meetings and data from the respective information systems. Quantitative data was also obtained from the analysis of these documents.

The approach used for data collection from face-to-face interviews and analysis of documents comprised the following steps (details are presented in Appendix B):

- Identify relevant respondents and their roles in the transnational setup.
- Understand the typology of the case, obtain the functional and the structural attributes, and identify the transnational elements.
- Collect data related to the type of issues faced by the supply chain in terms of performance attributes, financial indicators and the governance model.
- Collect data related to the actions taken by supply chain managers to address the issues identified above.
- Analyse the collected data and report and interpret the findings.⁷³

The researcher made five trips to India between the years 2007 and 2009 to meet with the respondents from the Indian cases, and had numerous meetings with the

⁷³ Details of this step are presented in the next sub-section.

respondents from the South African cases. The researcher also attended seven supply chain conferences⁷⁴ to identify recent trends in transnational supply chain management. Respondents in the following 14 positions were interviewed for each of the four cases:

- a. supply chain manager/director
- b. special supply chain projects leader
- c. demand/supply/inventory manager(s)
- d. production manager(s)
- e. DC manager(s)
- f. finance manager(s)
- g. warehouse manager(s)
- h. procurement manager(s)
- i. brand/sales manager(s)
- j. marketing manager(s)
- k. chief information officer/IT manager(s)
- l. chief operating officer/CEO
- m. customer relations officer(s)
- n. HR manager(s).
