

**Triandis' Theory of Interpersonal Behaviour in
understanding software piracy behaviour in the
South African context**

Declaration

A research project submitted in partial fulfilment of the requirements for the degree of MA by coursework and Research Report in the field of Organisational Psychology in the Faculty of Humanities, University of the Witwatersrand, Johannesburg, on the 15th February 2010. I declare that this research project is my own, unaided work. It has not been submitted before for any other degree or examination at this or any other university.

Abstract

The aim of this research study was to explore whether a revised version of Triandis' (1977) Theory of Interpersonal Behaviour would provide an understanding of software piracy behaviour within the South African context. As South Africa has a high intention to pirate software but at the same time has one of the lowest proportions of software piracy in comparison to the rest of the world, this study employed a slightly modified version of Triandis' TIB in order to determine what the objective factors present in the external environment are that enable this behaviour to be performed with either ease or difficulty. In order to address this, the study employed a quantitative, non-experimental and cross-sectional research design. A questionnaire compiled of previously developed scales measuring perceived consequences, social factors, affect, intentions, habit, facilitating conditions and behaviour was assembled in order to address the research question and eight hypotheses. All scales had good reliabilities that ranged between .76 and .92 and were measured on a 4 point likert type scale. An online survey was designed on SurveyMonkey and a link was placed on IT Web's website for a period of six weeks. The sample size was 310 and consisted of a wide array of people who varied in terms of gender, age, race and occupation, including vast differences with regards to employment status, field of expertise and industry sector. Results provided sufficient evidence to suggest that affect, perceived consequences and social factors were all significantly and positively related to intention. The results also indicated that intention and habit are both able to predict software piracy behaviour. However, high intention and strong habit weighting do not always lead to the execution of behaviour. Therefore, the study demonstrated that facilitating conditions play an important role in determining whether a desired behaviour will be carried out or not. The findings illustrate that facilitating conditions and habit both moderate the intention-behaviour relationship and facilitating conditions moderates the habit-behaviour relationship. This study provided support for Triandis TIB with regards to its predictive power for gaining an understanding of software piracy behaviour. Practical and theoretical implications of these results are discussed as well as the areas in which anti-piracy campaigns can continue to become more focussed and directed in order to contribute to the reduction in South Africa's piracy rate.

Acknowledgements

I would like to express my sincere gratitude to the many individuals who helped me through my research and supported me throughout my Masters:

- Prof. Andrew Thatcher for his patience, support, encouragement and continued input during the research process. It is greatly appreciated.
- Mike Greyling, Peter Fridjhon and Greg Lee for their statistical help and advice. Their patience and support was invaluable and much appreciated.
- Ranka Jovanovic the editorial director at IT Web for posting the link to the piracy survey on their website. Siyabonga Africa for his help and assistance.
- Rochelle de Paiva from the Business Software Alliance (BSA) for her assistance and help in sourcing the research participation incentives. The BSA Board of Directors for providing the two i-pod nano's as incentives for my research study.
- Gary Oberholzer and Jeremy Maggs from Maggs on Media for inviting Prof. Thatcher and me to discuss the topic of software piracy and as a result generating exposure for participation in the study.
- Each and every participant who gave of their time to participate in my research. It is sincerely appreciated!
- My family for their love, generosity, support and faith in me throughout my Masters and entire studying career. My parents for their financial support and sacrifice, without which I would not have being able to get this far. To all my friends especially Cassandra Ramsay for her unwavering encouragement, love and support.
